Analytics

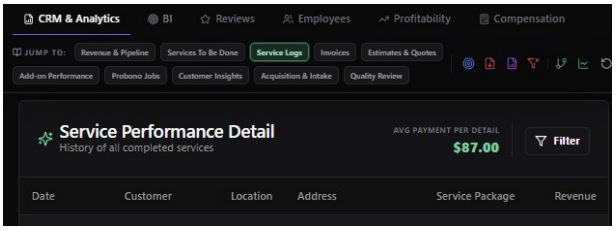

Analytics is the command center of the entire CRM — the single screen where every number the business produces gets organized, filtered, and made actionable. Rather than being one flat report, it's built around a persistent global date filter (defaulting to This Month, with All Time always available as a fallback) that governs ten distinct jump-to sections beneath it: Revenue & Pipeline, Service Logs, Invoices, Estimates & Quotes, Probono Jobs, Customer Insights, Acquisition & Intake, Quality Review, Services To Be Done, and Add-on Performance. Profitability and Compensation Calculator sit as their own dedicated top-level tabs alongside Analytics itself, since they warrant a full screen rather than a scrollable section. The bookmark row along the top lets you jump straight to any section without endless scrolling, and it stays visible and accessible no matter which tab or section you're currently viewing.

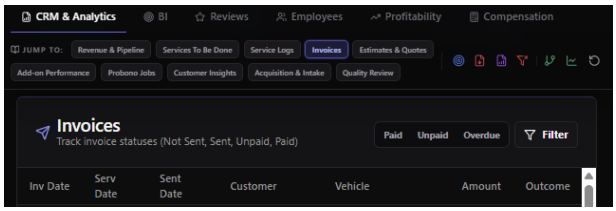

KEY FEATURES

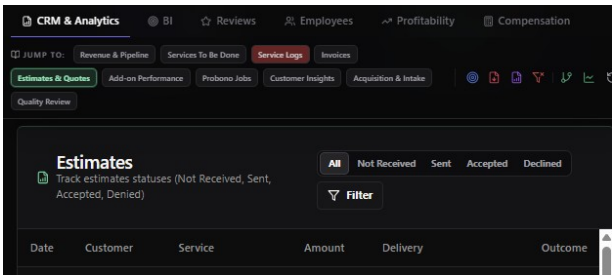

- Global date filter (This Month default, All Time always selectable) governs every section at once
- Status-based sort/filter buttons on Estimates (Not Received/Sent/Accepted/Declined), Invoices (Paid/Unpaid/Overdue), Acquisition & Intake (Prospects/Customers/Lost), and Quality Review (5 Star/Under 5 Stars)
- Persistent Jump To bookmark row, always visible regardless of active tab or section
- Individual sections can override the global filter with their own date range when needed

Business Intelligence

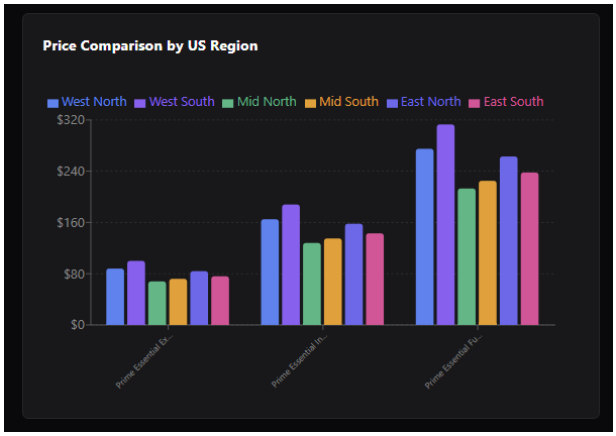

While CRM & Analytics focuses on the operational, day-to-day numbers of running the business — bookings, invoices, estimates — Business Intelligence takes a step back to look at broader, higher-level trends across the business as a whole. This is the tab for spotting patterns that only become visible over longer stretches of time: seasonal demand shifts, which services are trending up or down, and how the business is performing this quarter or year compared to the last.

KEY FEATURES

- Cross-business trend analysis, distinct from day-to-day operational tracking
- Longer time-horizon view than the Analytics page's default monthly filter
- Supports bigger-picture strategic decisions rather than daily task management

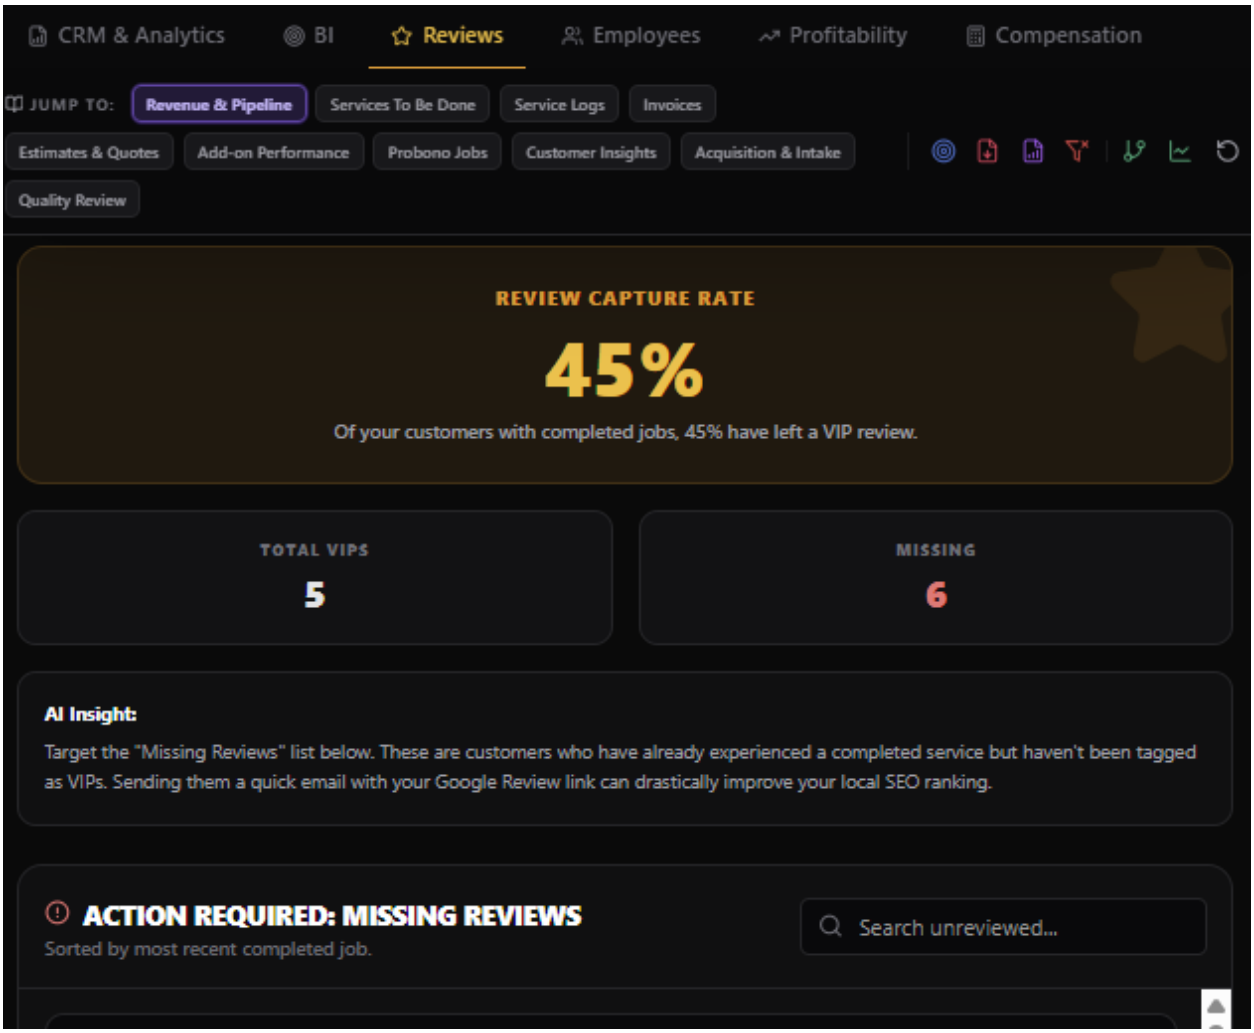

Reviews

The Review Intelligence tab is the central home for everything related to customer feedback and reputation — pulling together Google reviews, internal quality logs, and sentiment tracking in one place, separate from the job-by-job Quality Review section inside the main Analytics page. Where Analytics' Quality Review shows review status tied to individual completed jobs, this tab is built for a wider view of reputation and customer sentiment trends across the whole business over time.

KEY FEATURES

- Centralized view of Google reviews and internal feedback logs
- Sentiment tracking across the full customer base, not just per-job
- A dedicated home for reputation management, separate from job-level tracking

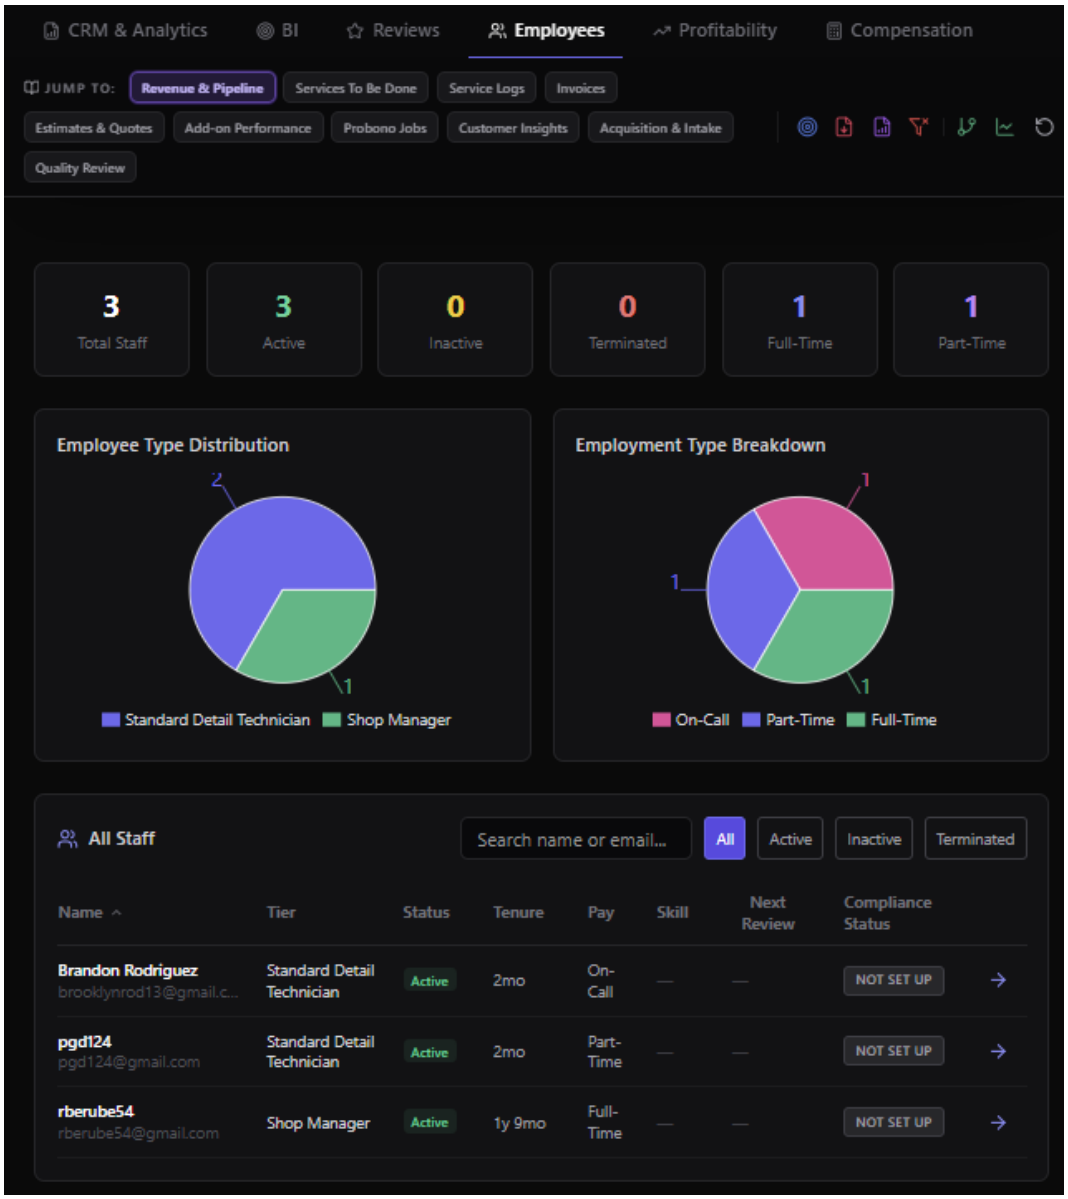

Employees

The Employees tab brings together staff-level performance and management data in one dedicated space — a more analytics-focused counterpart to the Company Employees profile system found under Staff Management. Where Company Employees holds each team member's core profile and records, this tab is where their performance, productivity, and contribution to the business get analyzed over time.

KEY FEATURES

- Staff performance and productivity tracking at the tab level
- Complements (rather than duplicates) the Company Employees profile system
- A dedicated analytics home for team-wide, not just individual, performance review

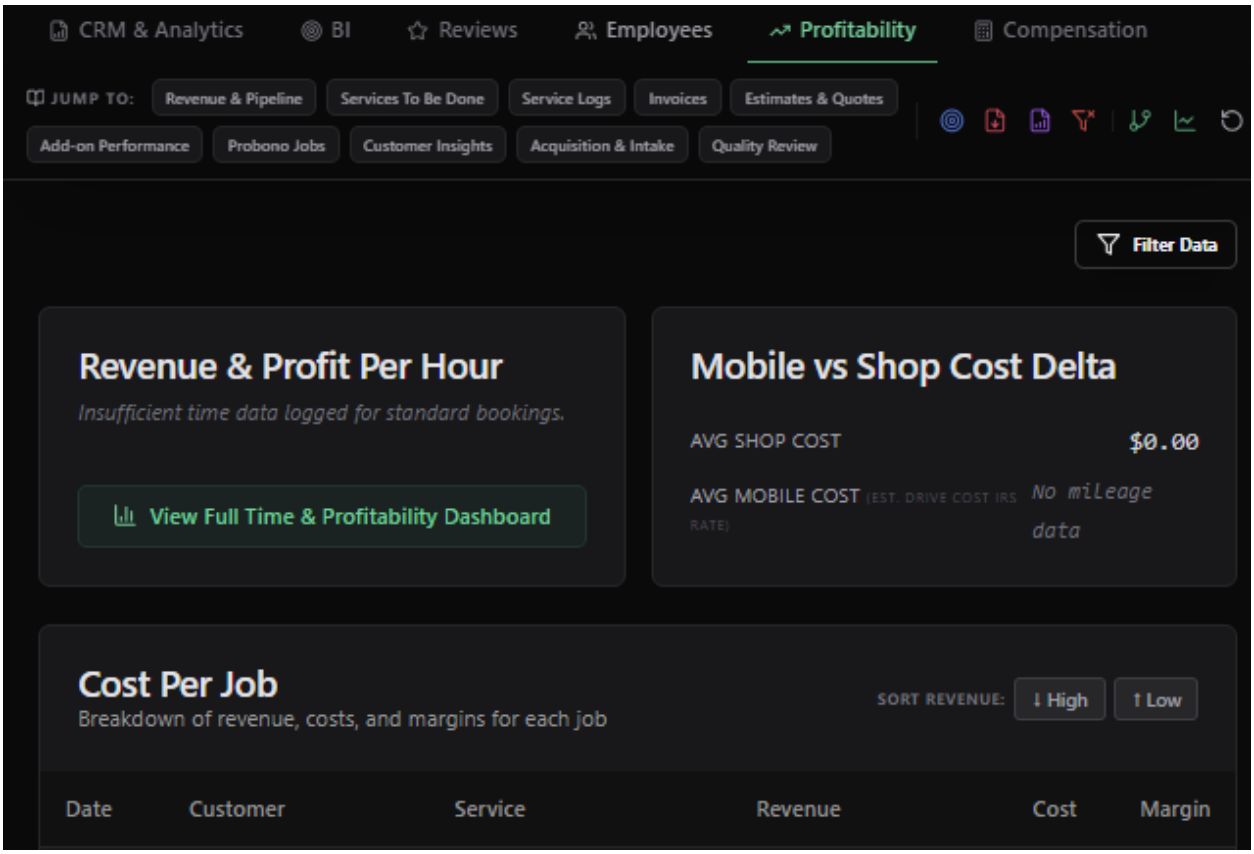

Profitability

Promoted from a bookmark to its own full tab, Profitability is where the real financial health of every job and package gets evaluated — not just how much revenue a service brings in, but whether it's genuinely worth doing at its current price once time and cost are accounted for. This includes the Time & Profitability dashboard's job-level analysis and the Market Pricing Analysis view, which benchmarks your pricing against typical market rates for comparable services.

KEY FEATURES

- Full-tab home for profitability analysis, not a scrollable section
- Houses Market Pricing Analysis for competitive rate comparison
- Works alongside Time & Profitability to connect job time against actual earnings

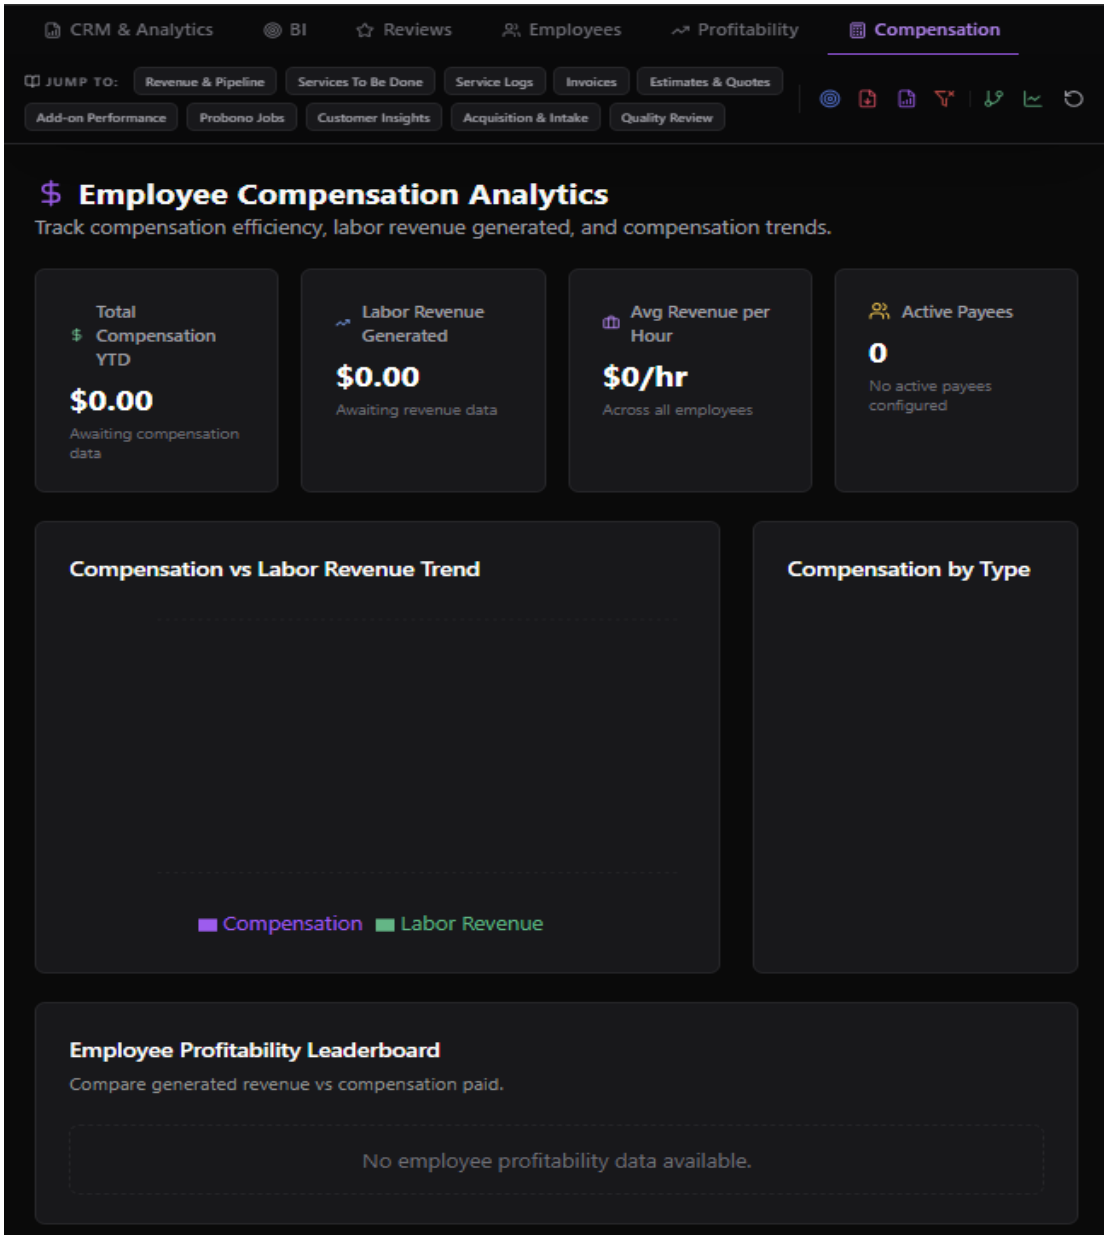

Compensation

Also promoted from a bookmark to its own tab, Compensation houses the Compensation Calculator — the pay-by-job (piece-rate) system that calculates technician pay based on the specific jobs they complete, rather than a flat hourly wage. Giving it a dedicated tab reflects how central fair, performance-based pay is to running a team, rather than burying it as one more item in a scrollable list.

KEY FEATURES

- Pay-by-job (piece-rate) compensation calculation, not flat hourly pay
- Rewards technician productivity and job complexity directly
- Full-tab visibility reflecting its importance to staff management

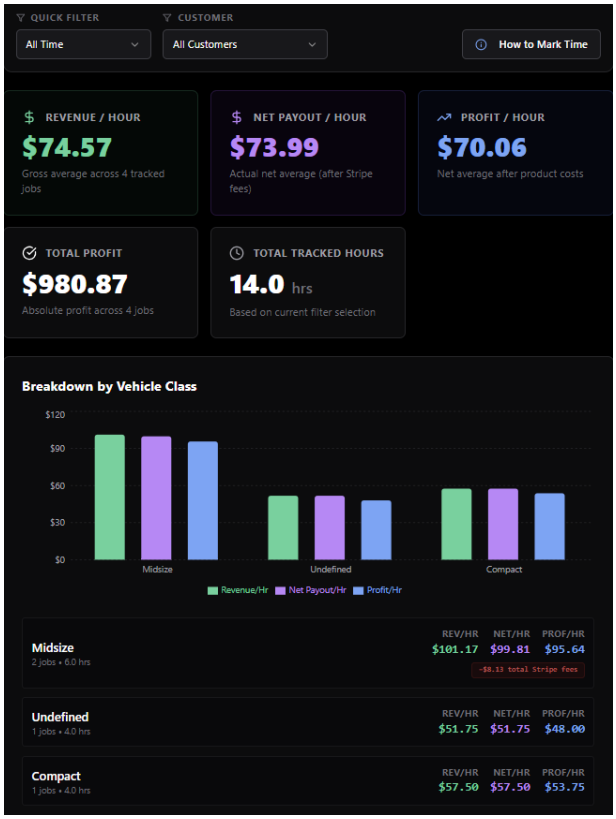

Time & Profitability

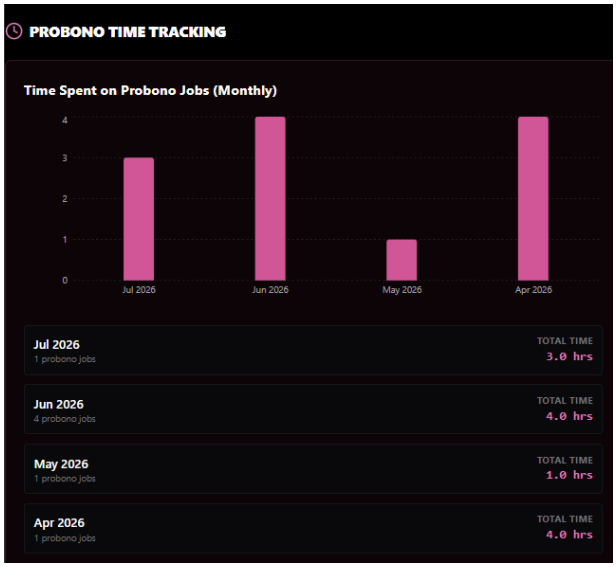

This dashboard answers a question most detailers never actually measure: is a given job worth the time it takes? It cross-references the actual time logged per job (via the Service Checklist) against the revenue that job generated, broken down by vehicle classification and service package. Over weeks and months, patterns emerge — certain package types might look profitable on paper but quietly eat far more labor time than their price justifies, while others turn out to be more efficient than assumed. This is the screen used to make real pricing and scheduling decisions rather than relying on gut feel.

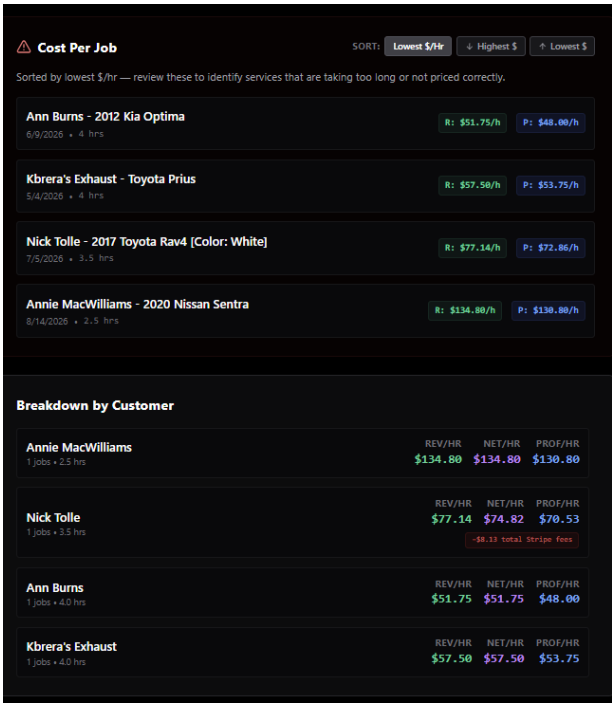

KEY FEATURES

- Time-per-job tracking cross-referenced against revenue
- Breakdown by vehicle classification and service package
- Surfaces which services are genuinely most efficient, not just highest-priced

Business Goals

A dedicated space for setting concrete business targets and tracking real progress against them over time — whether that's a monthly revenue target, a customer growth number, or a service volume goal. Rather than goals living only in your head or a sticky note, this dashboard keeps them visible and measurable, so progress (or the lack of it) is something you can act on rather than vaguely sense.

KEY FEATURES

- Set and track revenue, growth, and volume targets
- Visual progress tracking over custom time periods

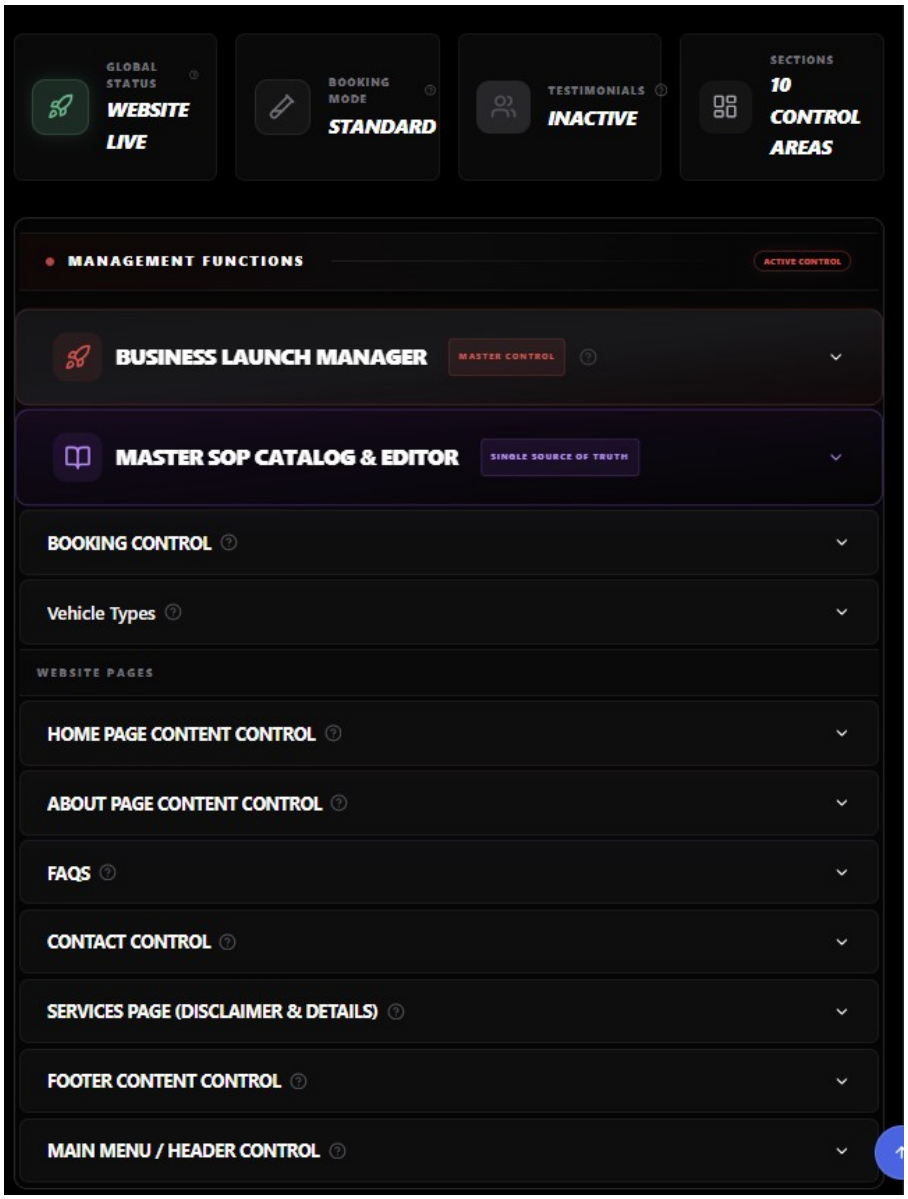

Website Administration

This is the control room for everything visible on the public-facing PrimeAutoDetail.net website, without needing to touch a single line of code. Home Page content, the About Page, FAQs, the Contact page, the Footer, the Main Menu and Header, Testimonials, and Vehicle Type Management for the public site are all editable directly from here. It's what lets the business's online presence evolve — new testimonials, updated service descriptions, seasonal messaging — without depending on a developer for every small change.

KEY FEATURES

- Home, About, FAQ, Contact, and Footer content all editable in one place
- Testimonials management for the public site
- Main Menu / Header control for site-wide navigation changes

Management Functions

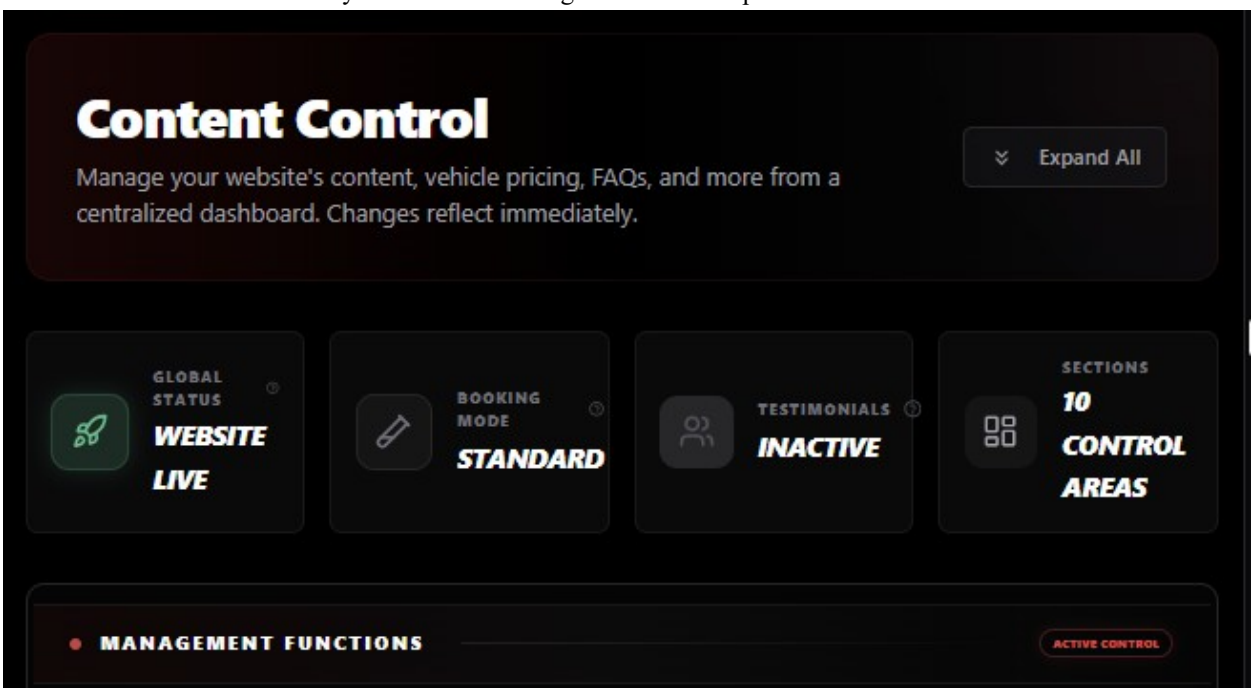

The first of three control groupings within Website Administration, covering the live, real-time switches that govern how the business and site currently behave.

Active Control

Active Control houses the live toggle switches governing real-time site and business behavior — including the Global Status indicators shown at the top of Website Administration (Website Live, Booking Mode, Testimonials). This is where those switches are actually flipped, not just displayed; a change made here takes effect immediately on the public-facing site.

KEY FEATURES

- Direct control over the live Website Live / Booking Mode / Testimonials switches
- Changes take effect immediately, not on a delay or publish cycle
- Central source for every real-time status flag shown at the top of Website Administration

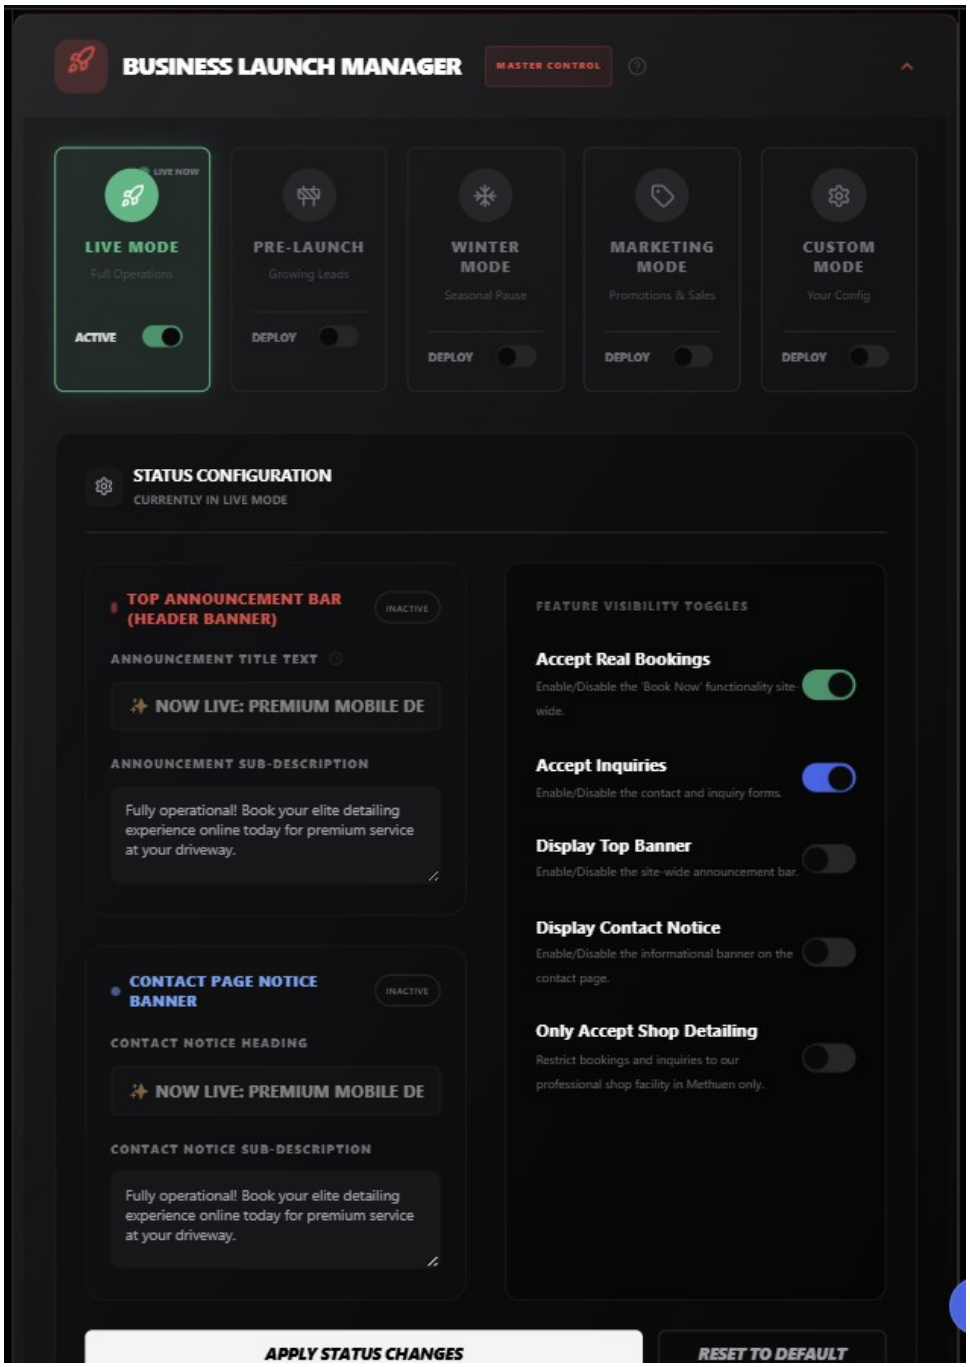

Business Launch Manager

Business Launch Manager handles business-wide launch and closure states — including winter and seasonal closures — so the entire business can be taken offline or reactivated for a season without manually editing dozens of individual settings one at a time.

KEY FEATURES

- One-switch control for seasonal or temporary business closures
- Prevents the need to manually toggle multiple settings for a single closure event
- Covers business-wide state, distinct from day-to-day booking availability

Live Mode — Full Operations, Active

Live Mode is the standard, fully-operational state of the business — the default mode for normal day-to-day running. Booking, customer intake, and all public-facing site features are fully active, with no restrictions or seasonal messaging overriding the regular customer experience.

KEY FEATURES

- Full booking and customer intake enabled, no restrictions
- The default operating state for normal business days
- No seasonal or promotional messaging overriding standard content

Pre-Launch Mode — Growing Leads

Pre-Launch Mode is built for the period before the business (or a new service area) is fully open for bookings — focused on capturing interest and building a lead pipeline rather than taking live appointments. It lets the public site collect prospect information and generate early interest, so there's already a warm audience the moment full booking opens.

KEY FEATURES

- Lead capture enabled without opening live booking
- Builds a prospect pipeline ahead of full launch
- Useful for a new business, new service area, or planned relaunch

Winter Mode — Seasonal Pause

Winter Mode reflects the reality that detailing demand (and feasibility, depending on climate) drops off sharply in colder months. Rather than manually adjusting dozens of individual settings every winter, this mode pauses or scales back normal operations with a single switch — and reverses just as easily when the season turns.

KEY FEATURES

- One-switch seasonal pause instead of manual setting-by-setting adjustments
- Designed around real seasonal demand and weather-driven feasibility
- Easily reversible once the season changes

Marketing Mode — Promotions & Sales

Marketing Mode shifts the public site's messaging and emphasis toward active promotions, discounts, or sales campaigns — surfacing offers more prominently for a limited-time push, such as a holiday promotion or a new-customer discount campaign, without needing to manually restyle the site for each one.

KEY FEATURES

- Prioritizes promotional and discount messaging site-wide
- Built for limited-time campaigns rather than permanent changes
- Reverts cleanly to standard presentation once a promotion ends

Custom Mode — Your Config

Custom Mode steps outside the four preset modes entirely, letting the business run under a manually defined configuration that doesn't fit neatly into Live, Pre-Launch, Winter, or Marketing — useful for a one-off situation or a transitional period that needs its own specific combination of settings.

KEY FEATURES

- A manually configured state outside the four standard presets
- Suited to one-off or transitional situations
- Full flexibility when none of the preset modes fit the current need

Master Control

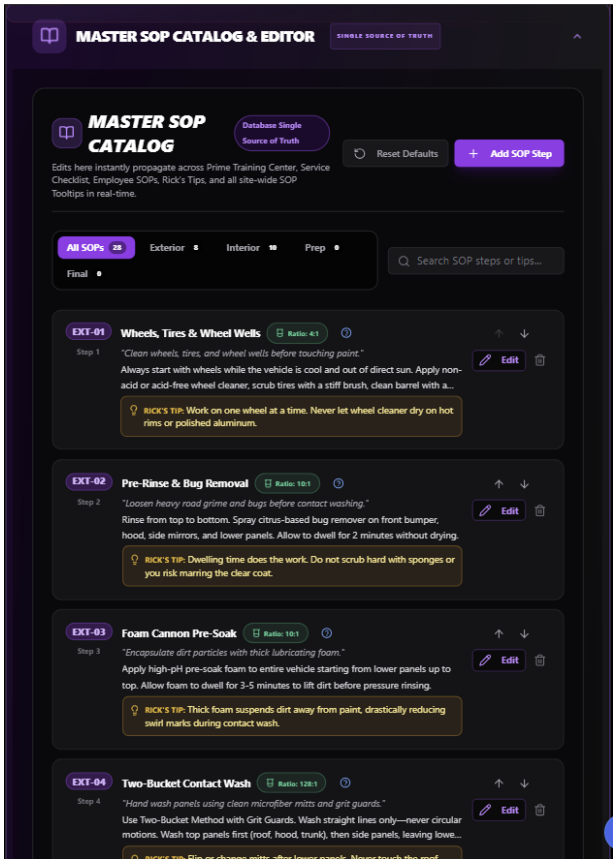

The second control grouping, covering procedure content, booking logic, and vehicle classification as they surface on the public website.

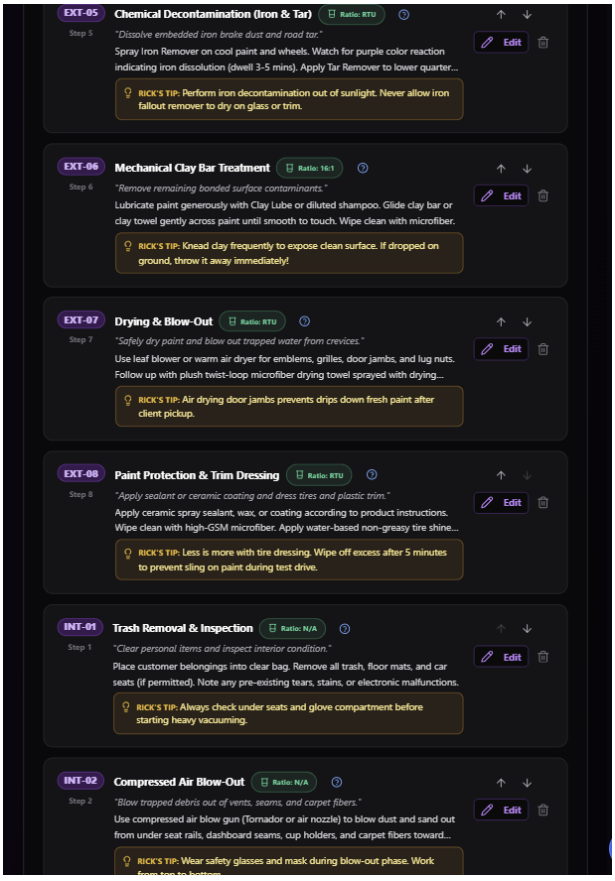

Master SOP Catalog & Editor

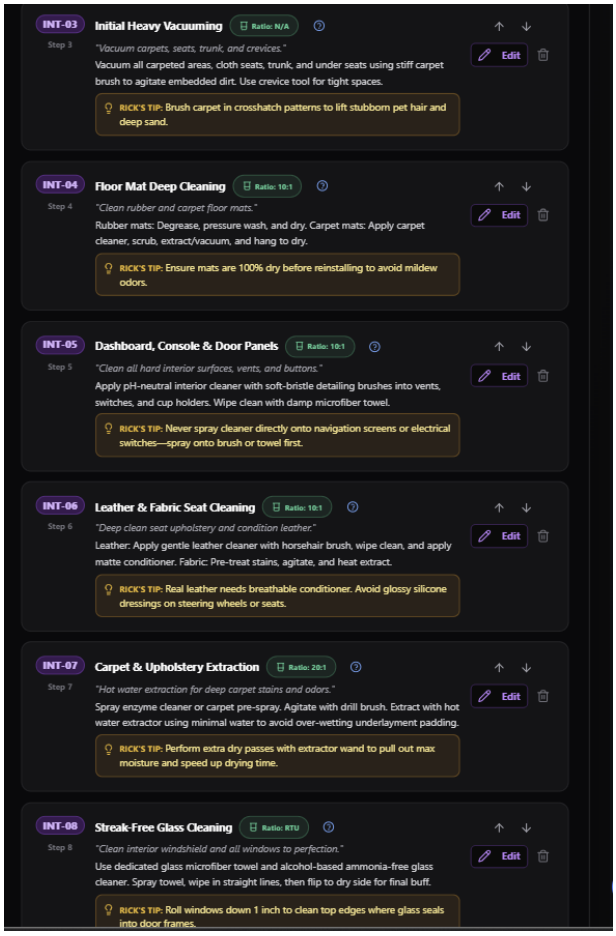

The Master SOP Catalog & Editor is the same underlying SOP editing system referenced throughout the Prime Learning Center, surfaced here because procedure content can directly affect what's shown publicly — for example, service descriptions derived from documented SOPs.

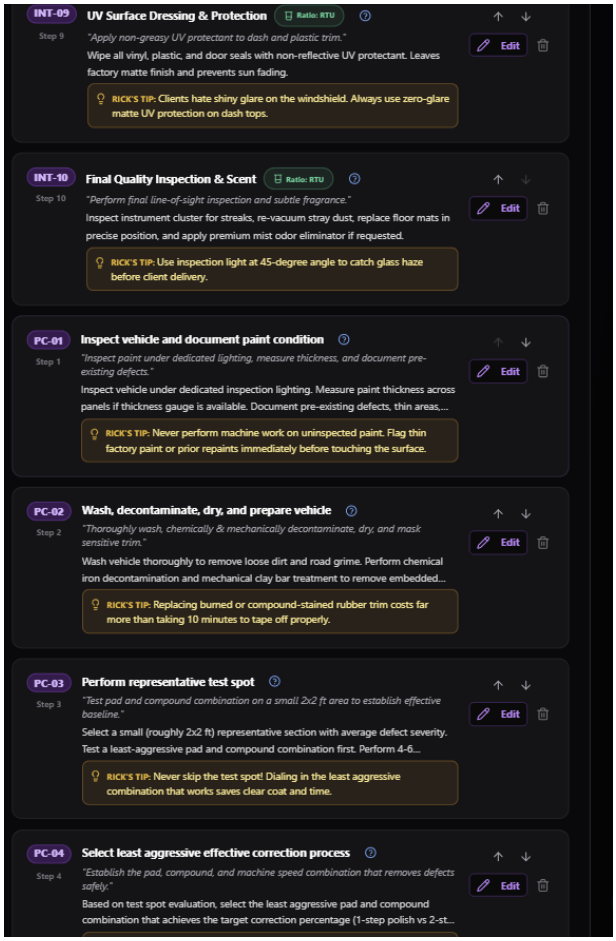

KEY FEATURES

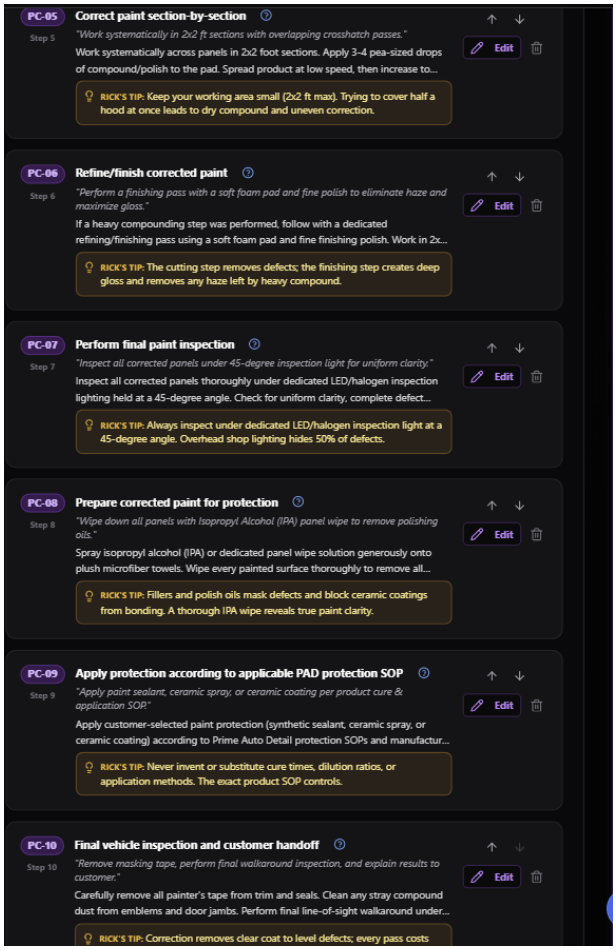

- Central catalog of every documented Standard Operating Procedure
- Edits here reflect in any public-facing content derived from SOP text
- Shared system, not a separate duplicate copy maintained just for the website

INT-03
Step 3
Initial Heavy Vacuuming
Ratio: N/A
"Vacuum carpets, seats, trunk, and crevices."
Vacuum all carpeted areas, cloth seats, trunk, and under seats using stiff carpet brush to agitate embedded dirt. Use crevice tool for tight spaces.
RICK'S TIP: Brush carpet in crosshatch patterns to lift stubborn pet hair and deep sand.
Edit
INT-04
Step 4
Floor Mat Deep Cleaning
Ratio: 10:1
"Clean rubber and carpet floor mats."
Rubber mats: Degrease, pressure wash, and dry. Carpet mats: Apply carpet cleaner, scrub, extract/vacuum, and hang to dry.
RICK'S TIP: Ensure mats are 100% dry before reinstalling to avoid mildew odors.
Edit
INT-05
Step 5
Dashboard, Console & Door Panels
Ratio: 10:1
"Clean all hard interior surfaces, vents, and buttons."
Apply pH-neutral interior cleaner with soft-bristle detailing brushes into vents, switches, and cup holders. Wipe clean with damp microfiber towel.
RICK'S TIP: Never spray cleaner directly onto navigation screens or electrical switches—spray onto brush or towel first.
Edit
INT-06
Step 6
Leather & Fabric Seat Cleaning
Ratio: 10:1
"Deep clean seat upholstery and condition leather."
Leather: Apply gentle leather cleaner with horsehair brush, wipe clean, and apply matte conditioner. Fabric: Pre-treat stains, agitate, and heat extract.
RICK'S TIP: Real leather needs breathable conditioner. Avoid glossy silicone dressings on steering wheels or seats.
Edit
INT-07
Step 7
Carpet & Upholstery Extraction
Ratio: 20:1
"Hot water extraction for deep carpet stains and odors."
Spray enzyme cleaner or carpet pre-spray. Agitate with drill brush. Extract with hot water extractor using minimal water to avoid over-wetting underlayment padding.
RICK'S TIP: Perform extra dry passes with extractor wand to pull out max moisture and speed up drying time.
Edit
INT-08
Step 8
Streak-Free Glass Cleaning
Ratio: RTU
"Clean interior windshield and all windows to perfection."
Use dedicated glass microfiber towel and alcohol-based ammonia-free glass cleaner. Spray towel, wipe in straight lines, then flip to dry side for final buff.
RICK'S TIP: Roll windows down 1 inch to clean top edges where glass seals into door frames.
Edit

INT-09
Step 9
UV Surface Dressing & Protection
Ratio: RTU
"Apply non-greasy UV protectant to dash and plastic trim."
Wipe all vinyl, plastic, and door seals with non-reflective UV protectant. Leaves factory matte finish and prevents sun fading.
RICK'S TIP: Clients hate shiny glare on the windshield. Always use zero-glare matte UV protection on dash tops.
Edit
INT-10
Step 10
Final Quality Inspection & Scent
Ratio: RTU
"Perform final line-of-sight inspection and subtle fragrance."
Inspect instrument cluster for streaks, re-vacuum stray dust, replace floor mats in precise position, and apply premium mist odor eliminator if requested.
RICK'S TIP: Use inspection light at 45-degree angle to catch glass haze before client delivery.
Edit
PC-01
Step 1
Inspect vehicle and document paint condition
"Inspect paint under dedicated lighting, measure thickness, and document pre-existing defects."
Inspect vehicle under dedicated inspection lighting. Measure paint thickness across panels if thickness gauge is available. Document pre-existing defects, thin areas,...
RICK'S TIP: Never perform machine work on uninspected paint. Flag thin factory paint or prior repaints immediately before touching the surface.
Edit
PC-02
Step 2
Wash, decontaminate, dry, and prepare vehicle
"Thoroughly wash, chemically & mechanically decontaminate, dry, and mask sensitive trim."
Wash vehicle thoroughly to remove loose dirt and road grime. Perform chemical iron decontamination and mechanical clay bar treatment to remove embedded...
RICK'S TIP: Replacing burned or compound-stained rubber trim costs far more than taking 10 minutes to tape off properly.
Edit
PC-03
Step 3
Perform representative test spot
"Test pad and compound combination on a small 2x2 ft area to establish effective baseline."
Select a small (roughly 2x2 ft) representative section with average defect severity. Test a least-aggressive pad and compound combination first. Perform 4-6...
RICK'S TIP: Never skip the test spot! Dialing in the least aggressive combination that works saves clear coat and time.
Edit
PC-04
Step 4
Select least aggressive effective correction process
"Establish the pad, compound, and machine speed combination that removes defects safely."
Based on test spot evaluation, select the least aggressive pad and compound combination that achieves the target correction percentage (1-step polish vs 2-st...
Edit

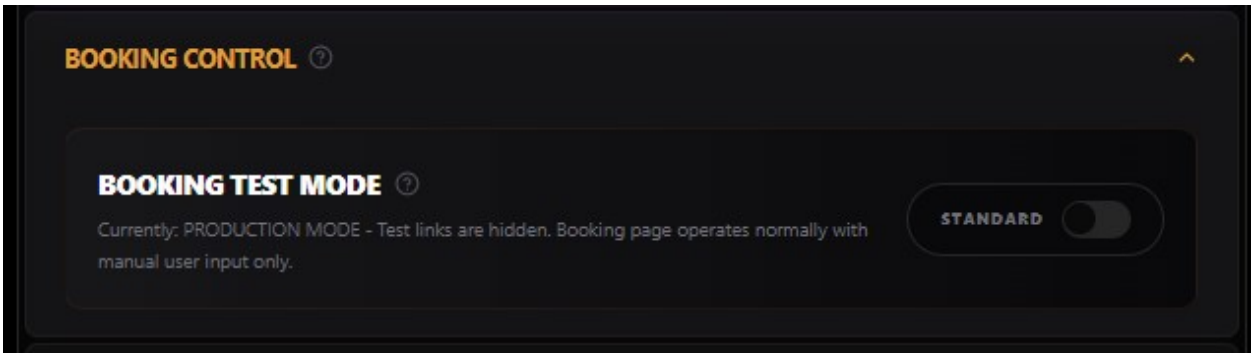

PC-05
Step 5
Correct paint section-by-section
"Work systematically in 2x2 ft sections with overlapping crosshatch passes."
Work systematically across panels in 2x2 foot sections. Apply 3–4 pea-sized drops of compound/polish to the pad. Spread product at low speed, then increase to...
RICK'S TIP: Keep your working area small (2x2 ft max). Trying to cover half a hood at once leads to dry compound and uneven correction.
Edit
PC-06
Step 6
Refine/finish corrected paint
"Perform a finishing pass with a soft foam pad and fine polish to eliminate haze and maximize gloss."
If a heavy compounding step was performed, follow with a dedicated refining/finishing pass using a soft foam pad and fine finishing polish. Work in 2x...
RICK'S TIP: The cutting step removes defects; the finishing step creates deep gloss and removes any haze left by heavy compound.
Edit
PC-07
Step 7
Perform final paint inspection
"Inspect all corrected panels under 45-degree inspection light for uniform clarity."
Inspect all corrected panels thoroughly under dedicated LED/halogen inspection lighting held at a 45-degree angle. Check for uniform clarity, complete defect...
RICK'S TIP: Always inspect under dedicated LED/halogen inspection light at a 45-degree angle. Overhead shop lighting hides 50% of defects.
Edit
PC-08
Step 8
Prepare corrected paint for protection
"Wipe down all panels with Isopropyl Alcohol (IPA) panel wipe to remove polishing oils."
Spray isopropyl alcohol (IPA) or dedicated panel wipe solution generously onto plush microfiber towels. Wipe every painted surface thoroughly to remove all...
RICK'S TIP: Fillers and polish oils mask defects and block ceramic coatings from bonding. A thorough IPA wipe reveals true paint clarity.
Edit
PC-09
Step 9
Apply protection according to applicable PAD protection SOP
"Apply paint sealant, ceramic spray, or ceramic coating per product cure & application SOP."
Apply customer-selected paint protection (synthetic sealant, ceramic spray, or ceramic coating) according to Prime Auto Detail protection SOPs and manufactur...
RICK'S TIP: Never invent or substitute cure times, dilution ratios, or application methods. The exact product SOP controls.
Edit
PC-10
Step 10
Final vehicle inspection and customer handoff
"Remove masking tape, perform final walkaround inspection, and explain results to customer."
Carefully remove all painter's tape from trim and seals. Clean any stray compound dust from emblems and door jambs. Perform final line-of-sight walkaround under...
RICK'S TIP: Correction removes clear coat to level defects; every pass costs
Edit

Booking Control

Booking Control governs booking-related settings as they're surfaced through the public website specifically — distinct from the full Hybrid Availability System used internally for day-to-day scheduling logic.

KEY FEATURES

- Public-facing booking settings, separate from internal scheduling logic
- Controls what a customer experiences when booking through the website
- Works alongside, not in place of, the Hybrid Availability System

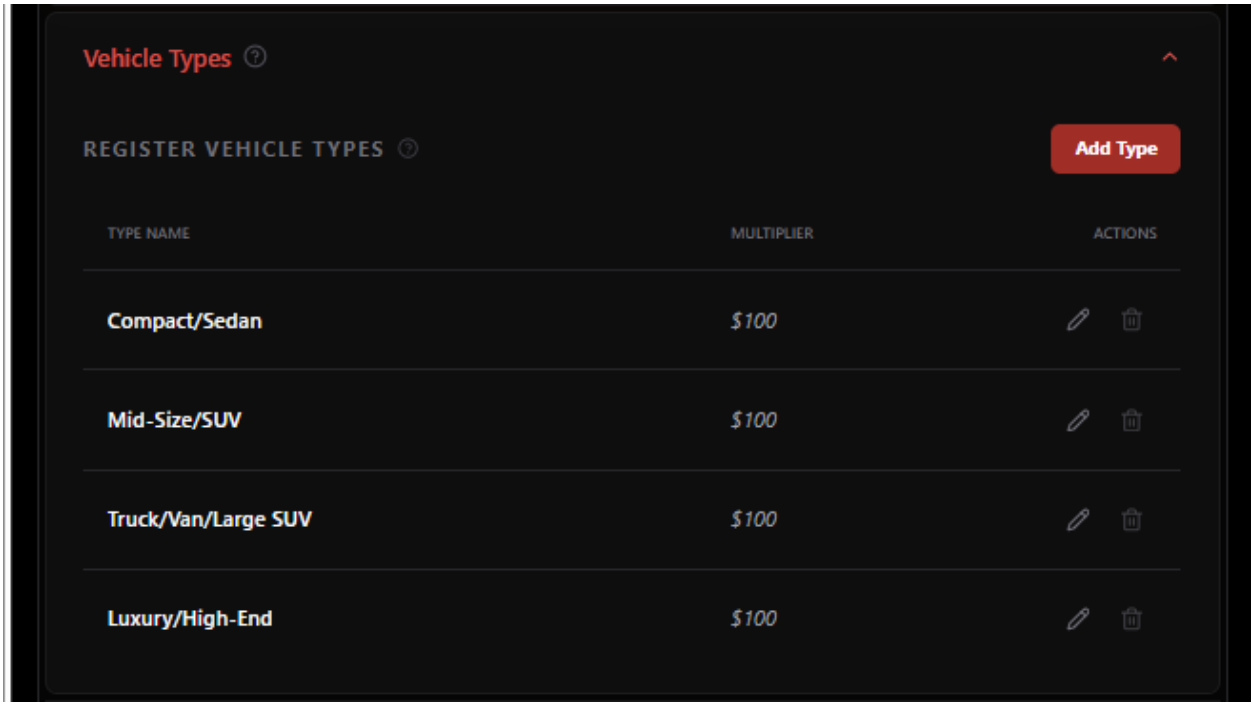

Vehicle Types

Vehicle Types manages the public-facing display and description of the four vehicle classification tiers — Compact/Sedan, Mid-Size/SUV, Truck/Van/Large SUV, and Luxury/High-End — kept in sync with the same classification system used internally for pricing and scheduling.

KEY FEATURES

- Controls how vehicle tiers are labeled and described to customers
- Stays synced with the internal classification system used for pricing
- Ensures customers see consistent tier names across booking and pricing

Website Pages

The third control grouping, covering the actual editable content of every public-facing page on the site.

Home Page Content Control

Home Page Content Control manages everything on the site's landing page — hero images, headline messaging, featured services, and any promotional content a first-time visitor sees before anything else.

KEY FEATURES

- Full control over hero imagery and headline messaging
- Featured service and promotional content management
- The first impression a new visitor gets of the business

About Page Content Control

About Page Content Control manages the business's About page — the story, background, and any credentials or certifications the business wants to highlight to build trust with a prospective customer.

KEY FEATURES

- Editable business story and background content
- Space for credentials and certifications

- Builds customer trust before a booking decision is made

FAQs

The FAQs control is the editable list of frequently asked questions shown to customers, letting common questions be added, removed, or reworded directly as real customer questions evolve over time, without needing a developer for every change.

KEY FEATURES

- Add, remove, or reword questions without developer involvement
- Keeps pace with real, evolving customer questions
- Reduces repetitive phone/email questions by answering them up front

Contact Control

Contact Control manages the public Contact page — contact methods, form fields, and any routing logic for how an inquiry submitted there reaches the business, feeding directly into the very first phase of the customer lifecycle: Lead Capture.

KEY FEATURES

- Controls contact methods and form field structure
- Governs how a submitted inquiry routes to the business
- Direct feed into the Lead Capture phase of the customer lifecycle

Services Page (Disclaimer & Details)

This control manages both the descriptive content for each service offered publicly and any legal or practical disclaimers attached to them — for example, conditions that may affect final pricing or scope — communicated up front to set correct customer expectations before booking.

KEY FEATURES

- Service descriptions and disclaimers managed in one place
- Sets accurate customer expectations before booking
- Reduces post-service disputes over scope or pricing conditions

Footer Content Control

Footer Content Control manages the site-wide footer appearing on every page — typically business hours, social links, secondary navigation, and legal links that need to stay consistent across the entire site.

KEY FEATURES

- Site-wide content, consistent across every page automatically
- Covers business hours, social links, and legal footer content
- One edit updates the footer everywhere it appears

Main Menu / Header Control

Main Menu / Header Control manages the site's primary navigation structure and header content, determining what options a visitor sees first and how easily they can find their way to booking, pricing, or contact information.

KEY FEATURES

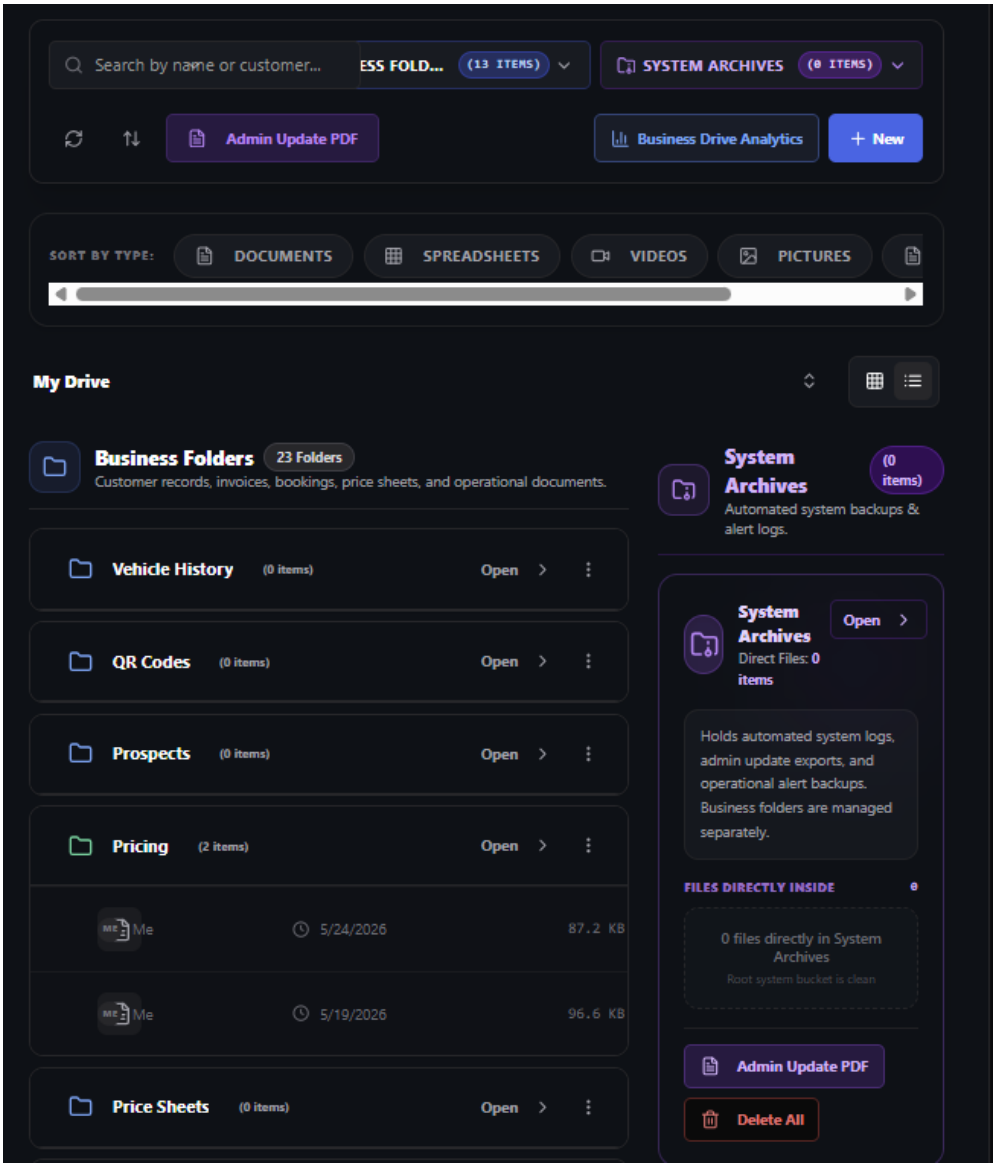

- Controls primary site navigation structure
- Shapes a visitor's first impression and ease of navigation
- Directly affects how quickly a visitor reaches booking or contact

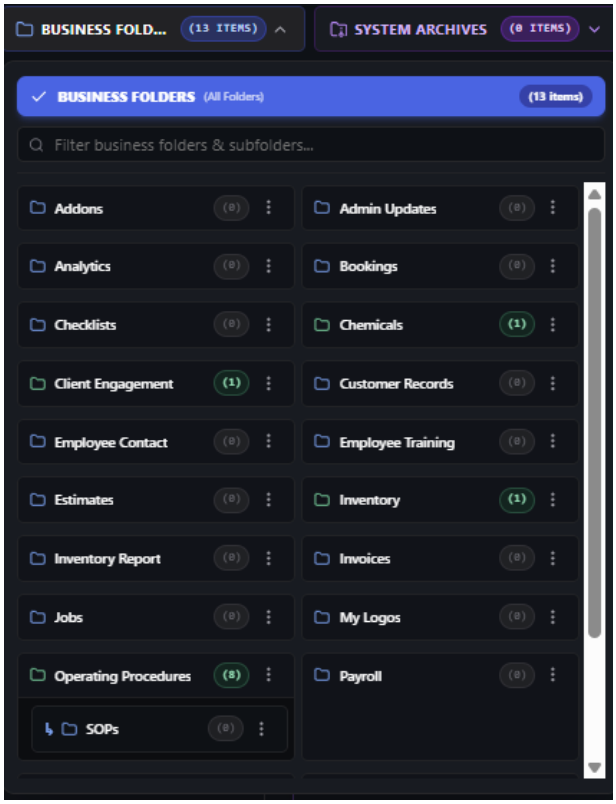

File Manager

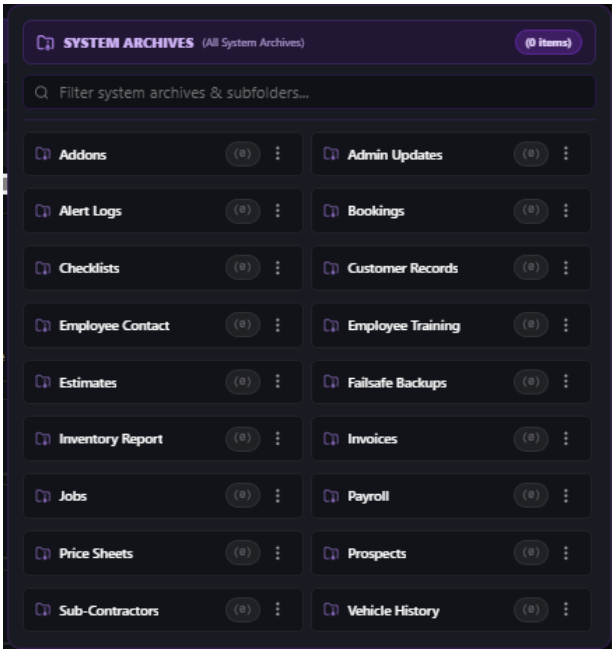

Also known as the Business Drive, this is the organized document backbone of the entire business — a structured set of folders (Checklists, Jobs, Bookings, Admin Updates, Invoices, Estimates, Customer Records, Employee Training, Payroll, Employee Contact, Add-ons, Vehicle History, Inventory Reports, Prospects, Price Sheets, QR Codes, and more) sitting side by side rather than buried inside one another. A separate System Archives area holds only system-generated alert files, keeping genuine business documents cleanly separated from automated system output.

KEY FEATURES

- Dedicated top-level folders for every major document category
- System Archives isolated from real business documents
- Two-way sync with related tools (e.g. Business Documents preview in Shop Setup)

Business Drive Analytics

Business Drive Analytics is a live reporting dashboard sitting on top of the File Manager, giving a real-time snapshot of the entire document system's health — total files, storage used, active folders, and a breakdown of file types across every business folder. Rather than clicking into each folder individually to see what's there, this view surfaces the whole picture at a glance: which folders are actually being used, which files are largest, and what's been added or modified most recently.

KEY FEATURES

- Live counts for total files, storage used, and active vs. empty folders
- File type distribution breakdown (PDFs, Pictures, Spreadsheets, Documents, Videos, Audio, Other)
- Folder-by-folder directory breakdown showing item counts across every Business Folder
- Top Largest Files and Recently Added/Modified panels for quick housekeeping

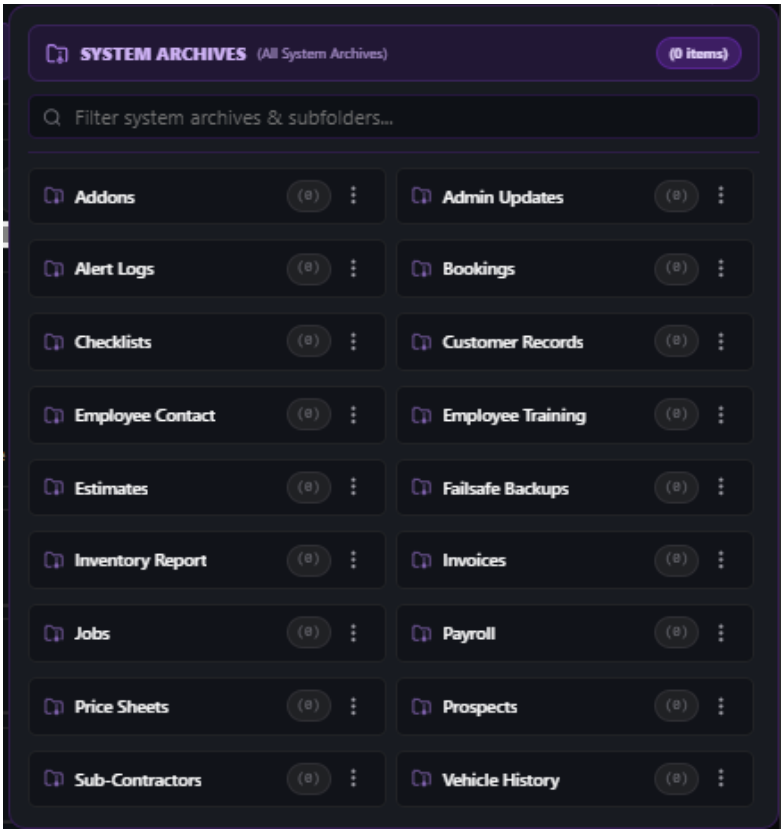

System Archives

System Archives is a dedicated folder area within the File Manager reserved exclusively for system-generated alert files — kept deliberately separate from the real, human-created business documents living in folders like Invoices, Estimates, and Customer Records. This separation exists specifically so automated output never gets mixed in with genuine business paperwork, keeping the main Business Folders clean and easy to search.

KEY FEATURES

- Holds only automatically generated alert files, never manually created documents
- Kept structurally separate from the main Business Folders, not nested inside them
- Prevents system-generated clutter from mixing into real business recordkeeping

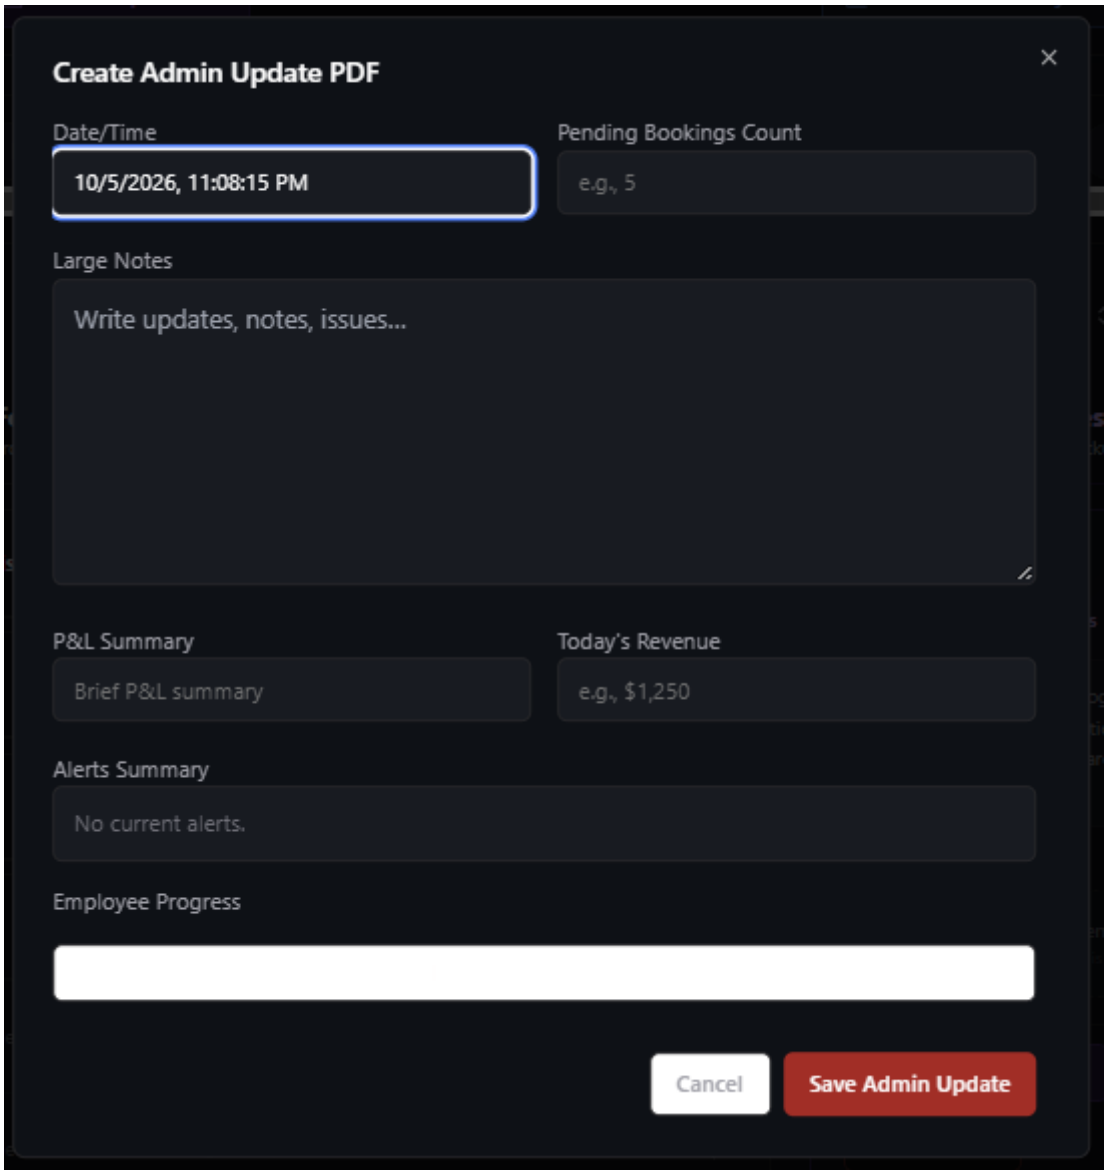

Admin Update PDF

Admin Update PDFs are formal "Application Update & Verification Report" documents generated after a significant update or feature completion in the CRM — each one documenting what was built, how to test it, and any important notes going forward, signed and dated for a permanent paper record. These are filed using a consistent naming convention and stored both in the File Manager's Business Folders and in a separate local App Docs archive, building a running paper trail of every major change made to the system over time.

KEY FEATURES

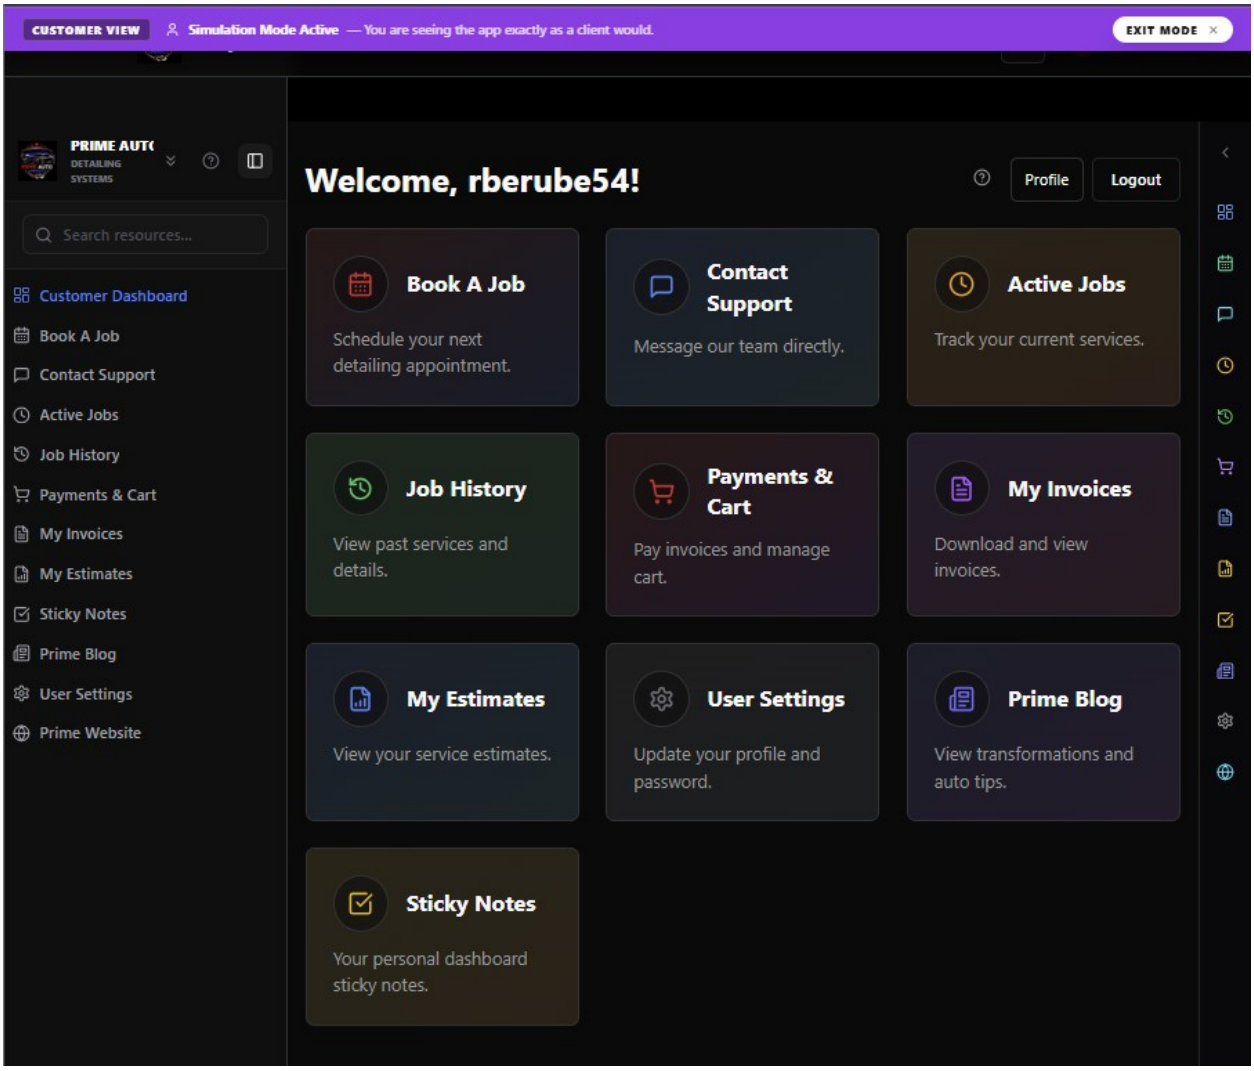

- Standardized "Application Update & Verification Report" format: what was built, how to test, notes going forward
- Consistent file naming for easy chronological reference
- Stored in both the File Manager and a local archive, creating a dual-location paper trail
- Every generated report includes an origination marker, so a printed copy can always be traced back to its source

VIEW AS

2 feature pages in this category

View As Customer

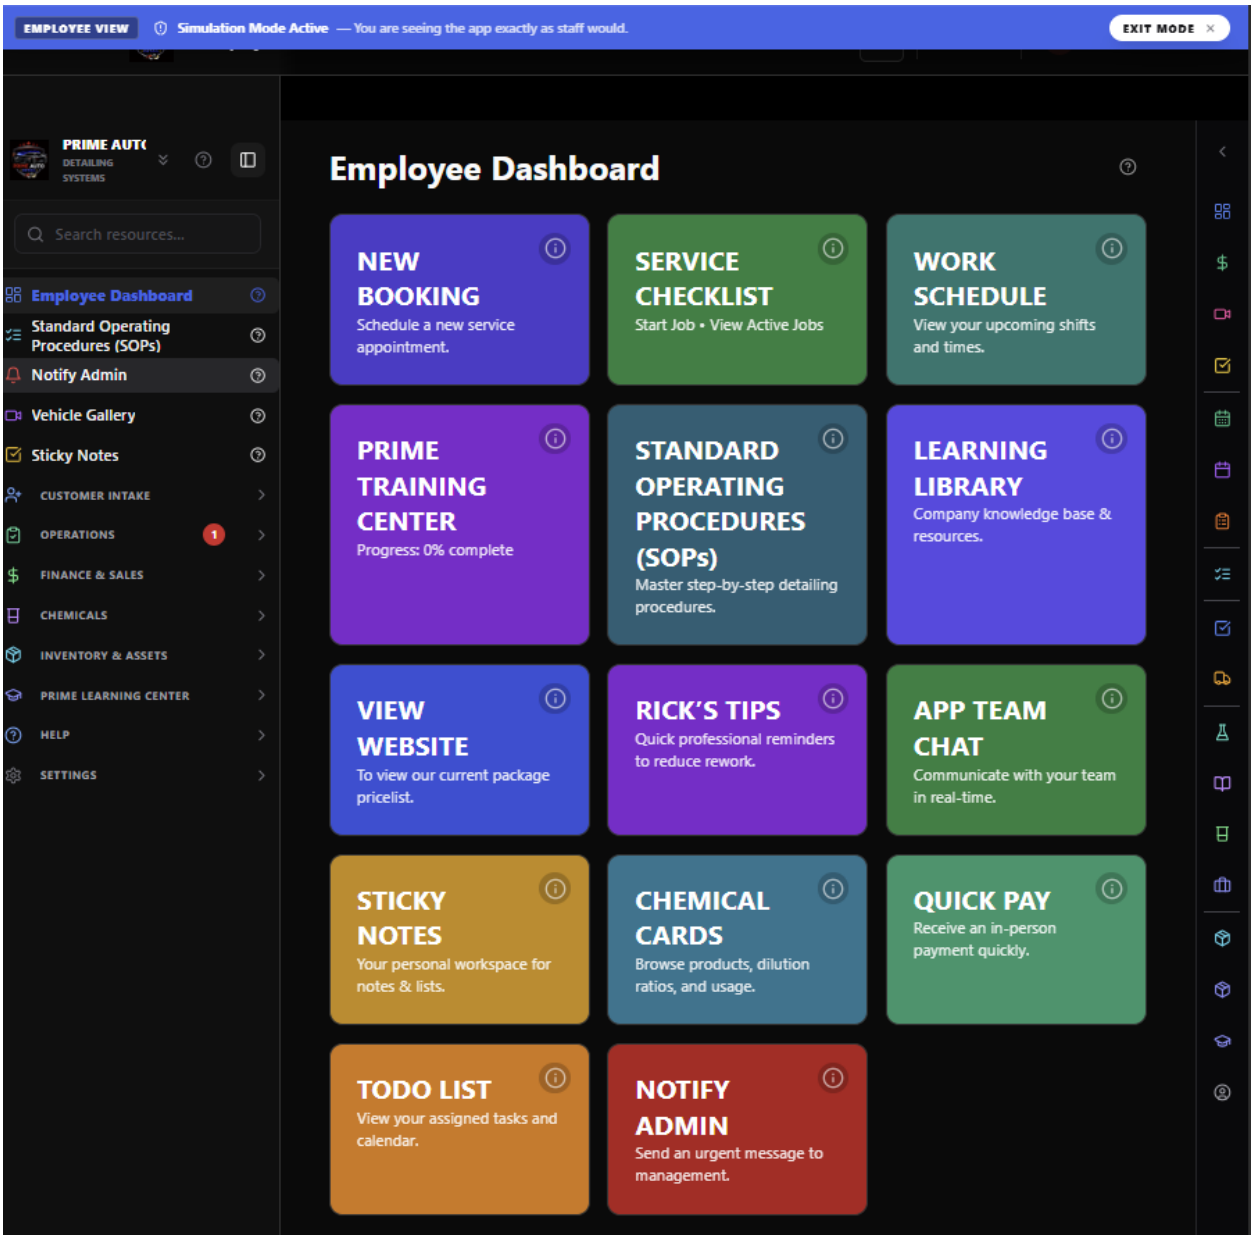

This mode drops you directly into the exact experience a real customer has when they log into their own portal — their booking history, their vehicles on file, their invoices and estimates, exactly as they'd see them. It exists so you never have to guess whether a change you made on the admin side actually looks right from the customer's perspective; you can simply look for yourself, using the same account structure a real customer would use, without needing a separate throwaway test account.

KEY FEATURES

- Exact replica of the live customer portal experience
- No separate test account needed to verify customer-facing changes

View As Employee

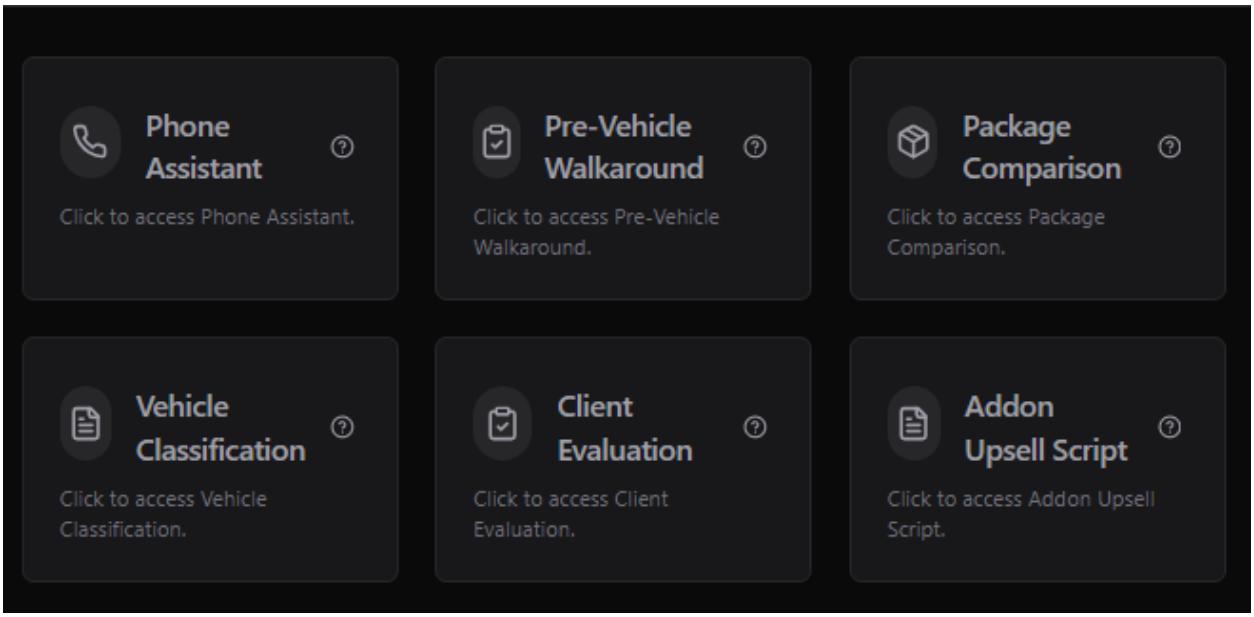

The employee-side counterpart to View As Customer — a live preview of exactly what a staff member sees once they log in under their role. Since permissions vary by role, this is the fastest way to confirm that an employee genuinely can (or genuinely cannot) access something, rather than assuming based on how the permission was configured.

KEY FEATURES

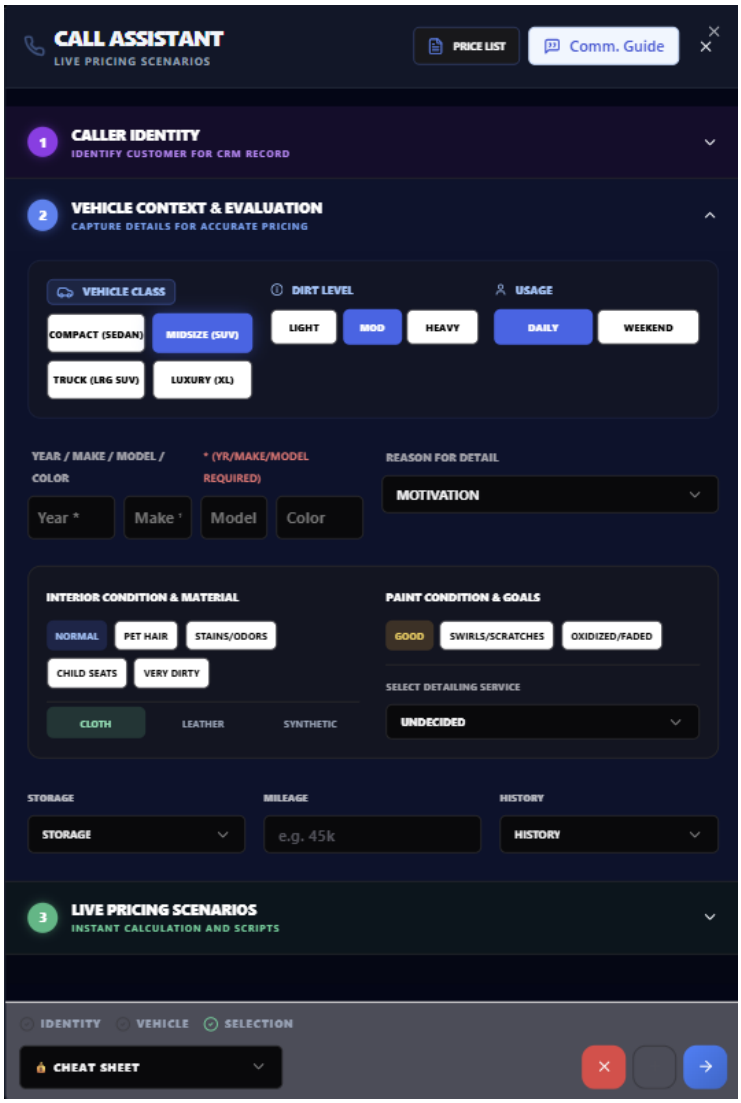

- Live preview scoped to actual employee role permissions
- Fast way to confirm access restrictions are working as intended

CUSTOMER INTAKE

6 feature pages in this category

Phone Assistant

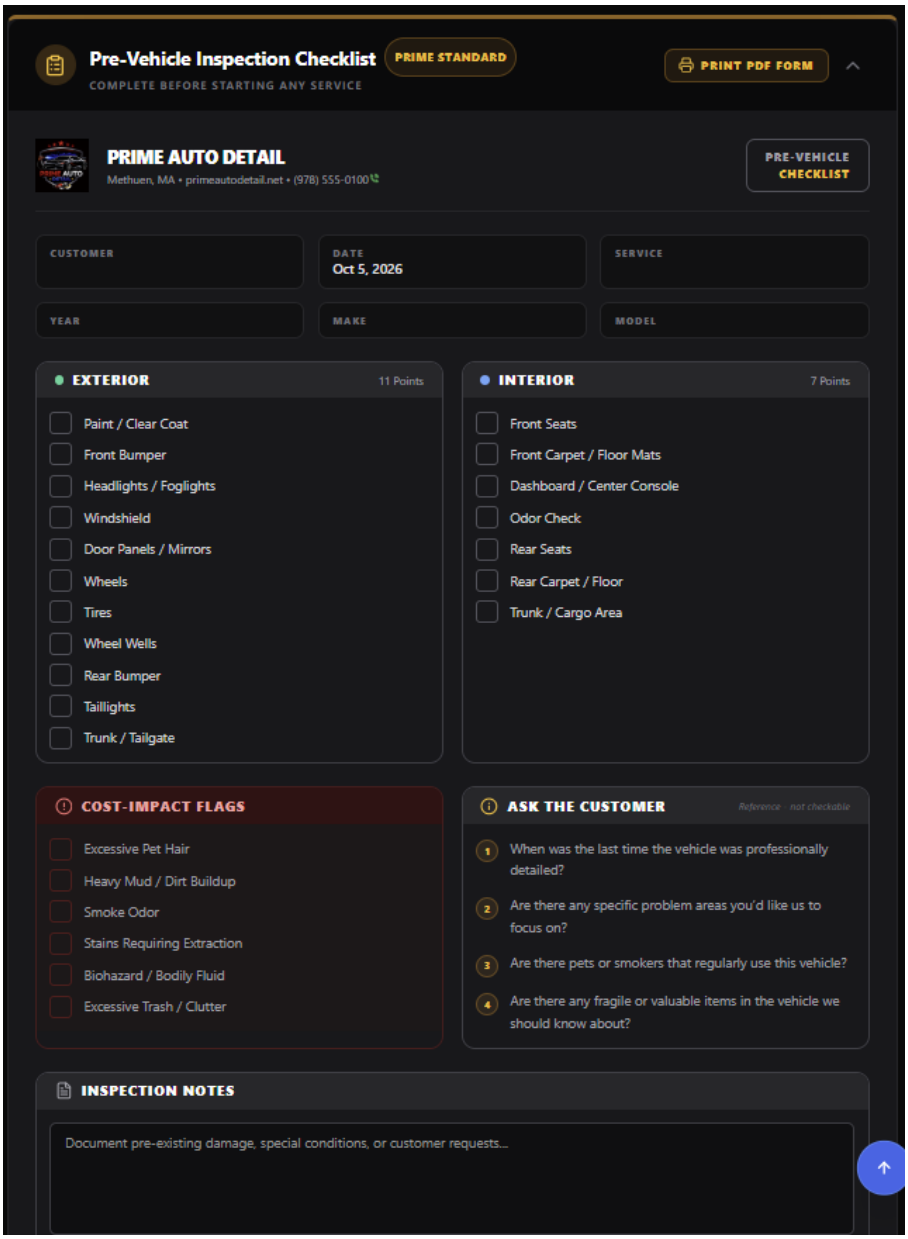

A structured script and talking-points guide built specifically for phone conversations — the moment a lead is often won or lost before any online form is ever filled out. It covers how to answer the most common questions a caller asks about services, pricing, and scheduling, and how to guide the conversation naturally toward a booked appointment rather than a vague 'I'll think about it.'

KEY FEATURES

- Ready-made responses to common customer phone questions
- Conversational guidance toward booking, not just information delivery

Pre-Vehicle Walk Around

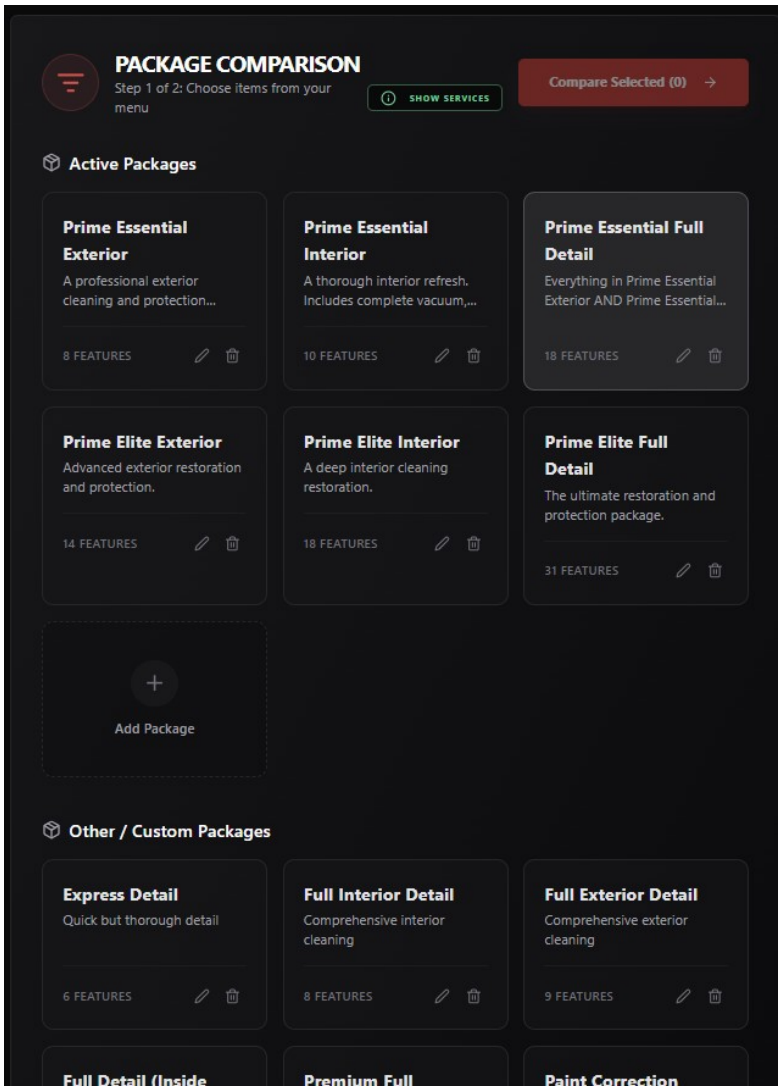

A structured tool for walking around a vehicle with the customer present, before any work begins, to jointly note its starting condition — existing scratches, dents, interior wear, or anything else worth documenting up front. This protects the business from being blamed for pre-existing damage, and it protects the customer by creating an honest, shared record everyone agreed to at the start.

KEY FEATURES

- Joint documentation with the customer present, not after the fact
- Creates a shared record protecting both business and customer

Package Comparison

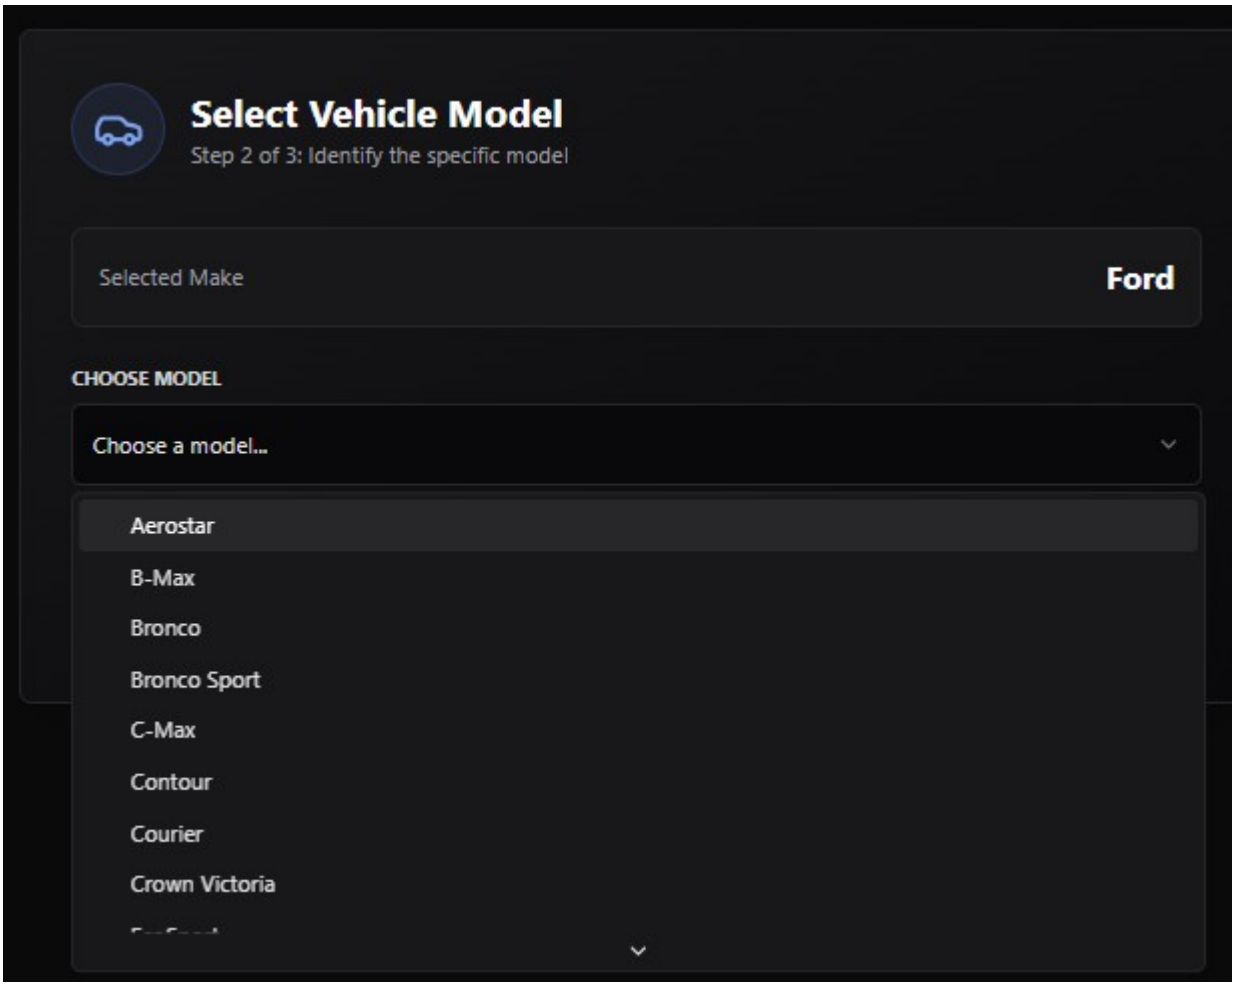

A clean, side-by-side visual comparison of the different service package tiers, built to help a customer actually understand what separates an Express Clean from a Full Essential from a Signature Ceramic package — not just in price, but in what's genuinely included. It's also a practical objection-handling tool: when a customer questions a price, this comparison makes the value difference between tiers immediately visible rather than something you have to explain from scratch every time.

KEY FEATURES

- Side-by-side tier comparison across all package levels
- Doubles as a built-in objection-handling and upsell tool

Vehicle Classification

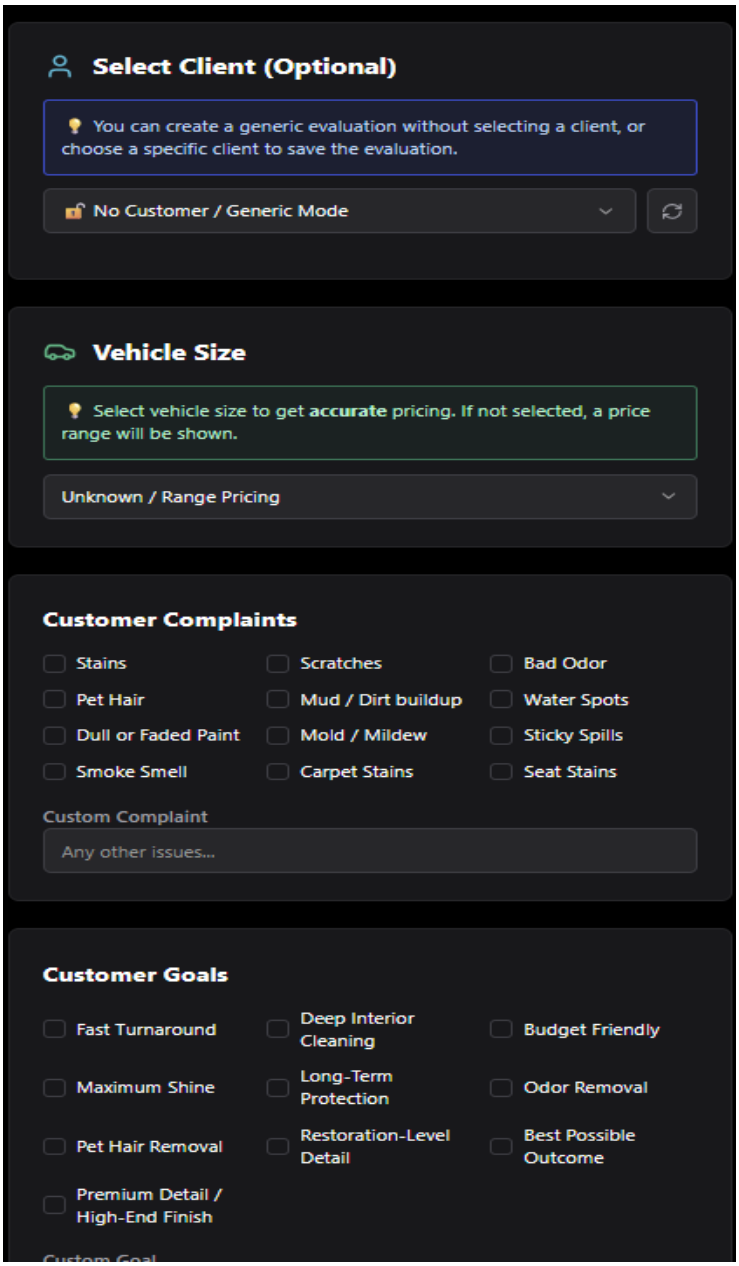

The foundational four-tier system — Compact/Sedan, Mid-Size/SUV, Truck/Van/Large SUV, and Luxury/High-End — that every price, package, and time estimate in the entire CRM is ultimately built around. Getting a vehicle correctly classified at intake is what makes every downstream number (pricing, scheduling, profitability tracking) accurate.

KEY FEATURES

- Four fixed vehicle tiers underpinning all pricing logic
- Single source of truth referenced by Package Pricing, Estimates, and Profitability

Client Evaluation

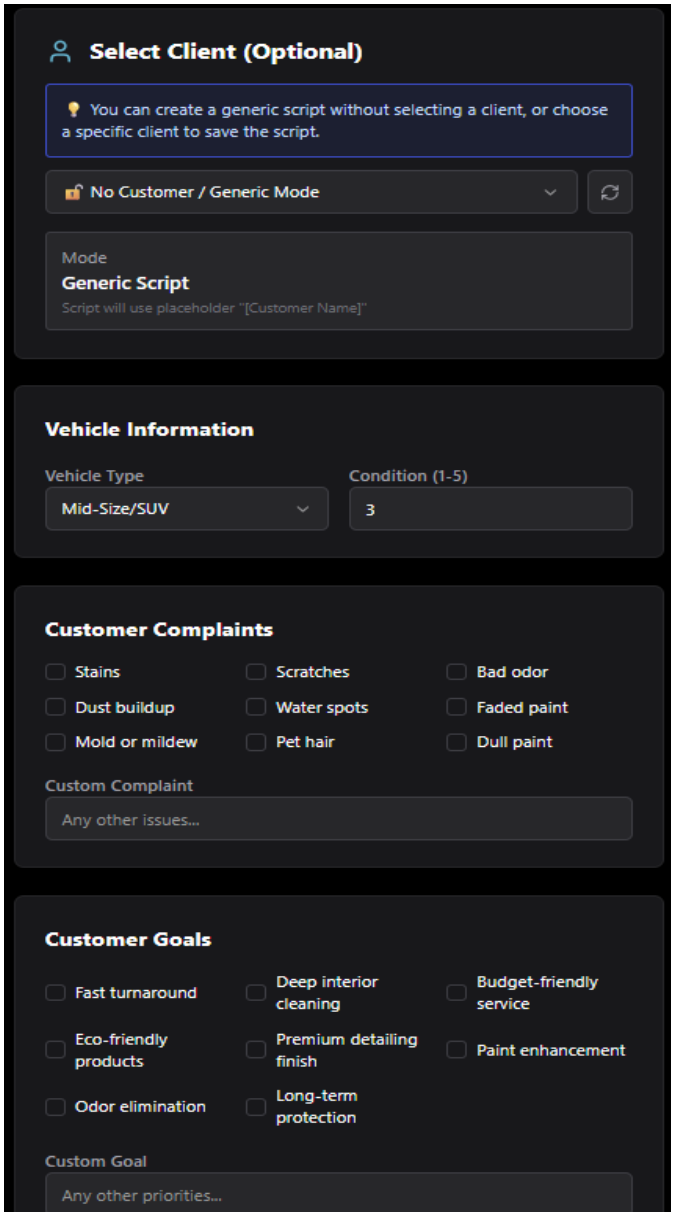

A more detailed condition-documentation tool than the basic walkaround, used to formally record a vehicle's pre-service state — useful for jobs with higher-value vehicles, more extensive service scope, or any situation where a more thorough record protects everyone involved.

KEY FEATURES

- Detailed pre-service condition documentation
- Suited to higher-value or higher-scope jobs

Addon Upsell Script

Scripted, ready-to-use language for introducing add-on services at exactly the right moment — during booking, during intake, or mid-service when an opportunity naturally presents itself. Rather than improvising an upsell pitch on the spot, this gives a consistent, tested way to explain the value of an add-on without it feeling like a hard sell.

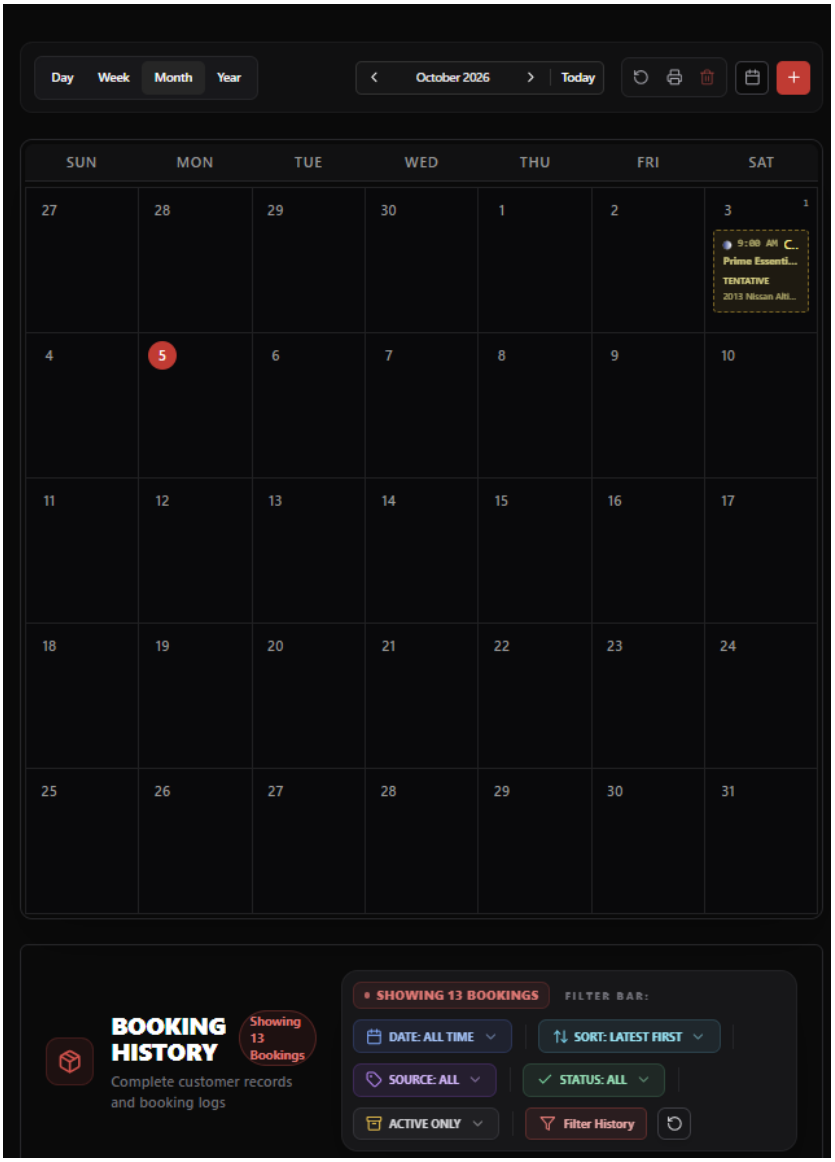

KEY FEATURES

- Ready-made upsell language for every add-on category
- Designed to feel natural rather than like a hard sell

OPERATIONS

7 feature pages in this category

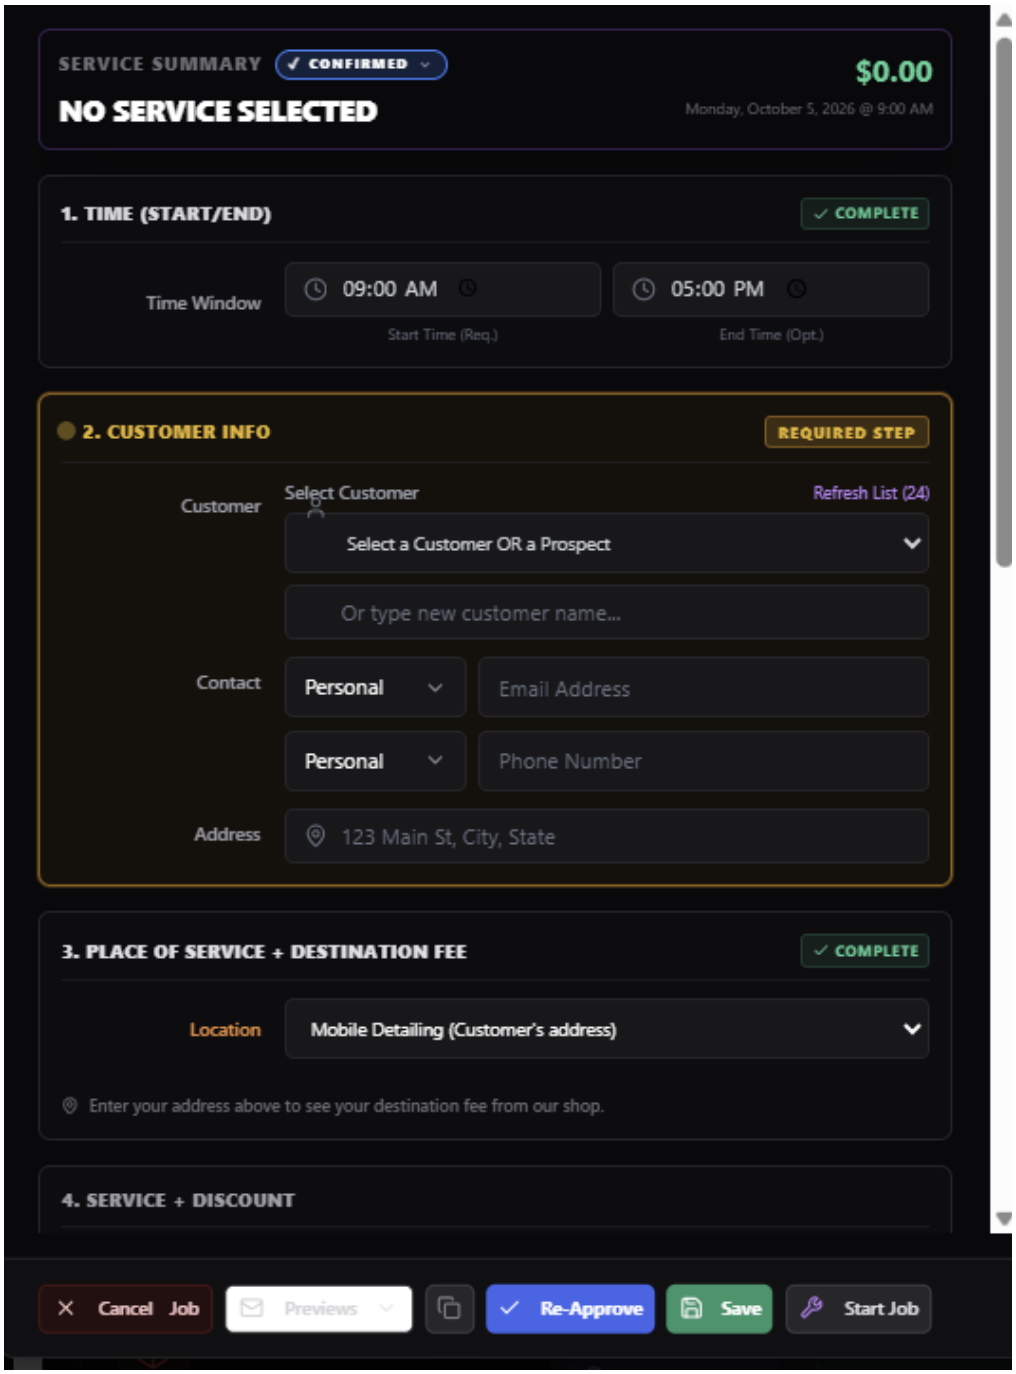

Bookings

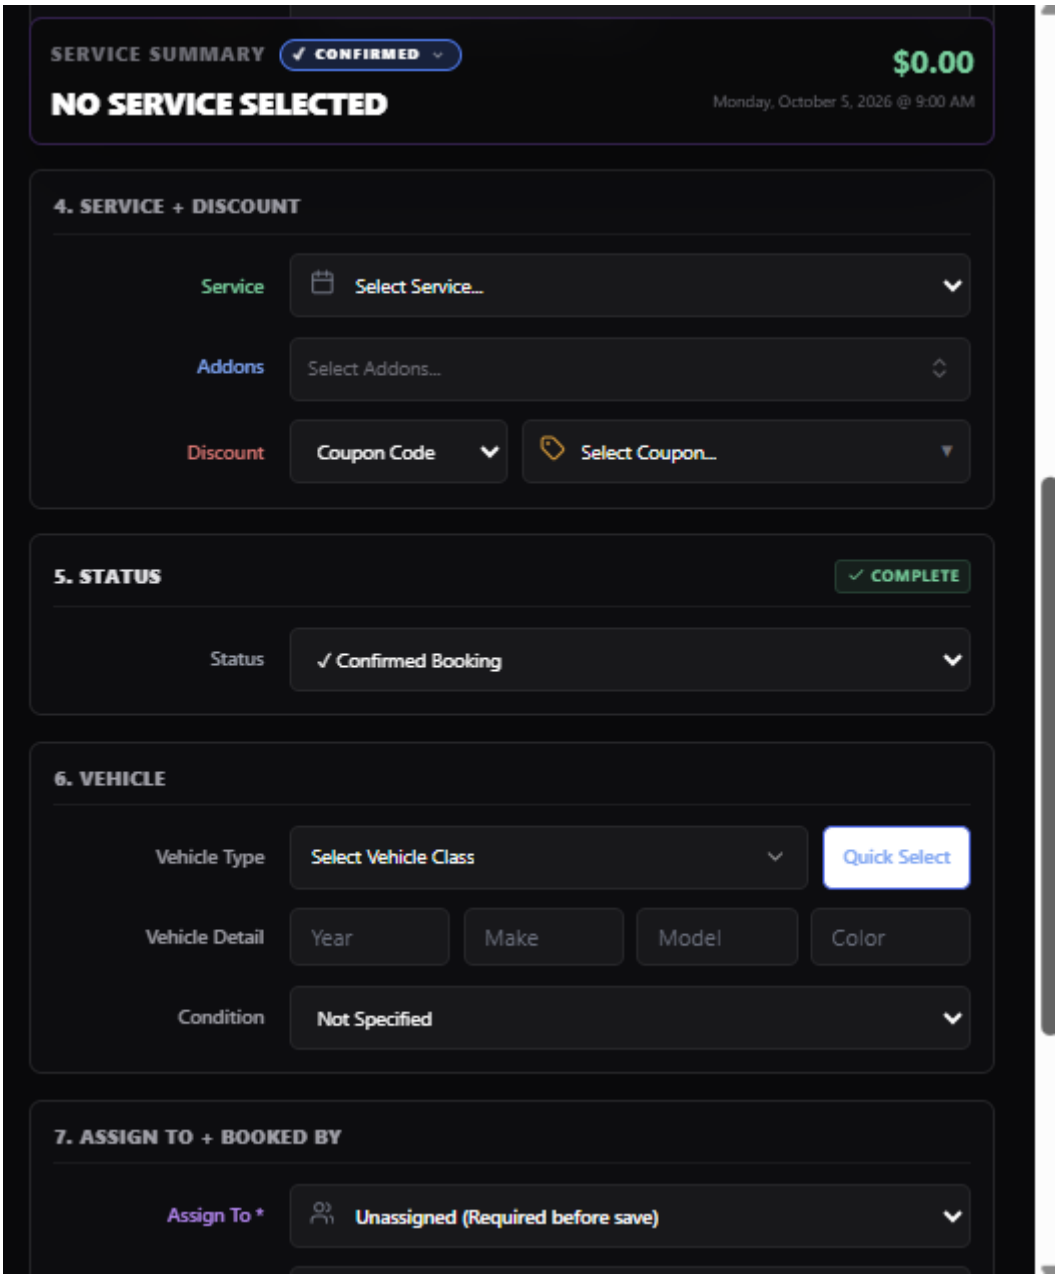

The operational heart of day-to-day scheduling — every confirmed appointment lives here, complete with the customer, their vehicle, the selected package and add-ons, and the service location. This is where a lead officially becomes a committed job on the calendar, and where the day's, week's, and month's real workload is visible at a glance.

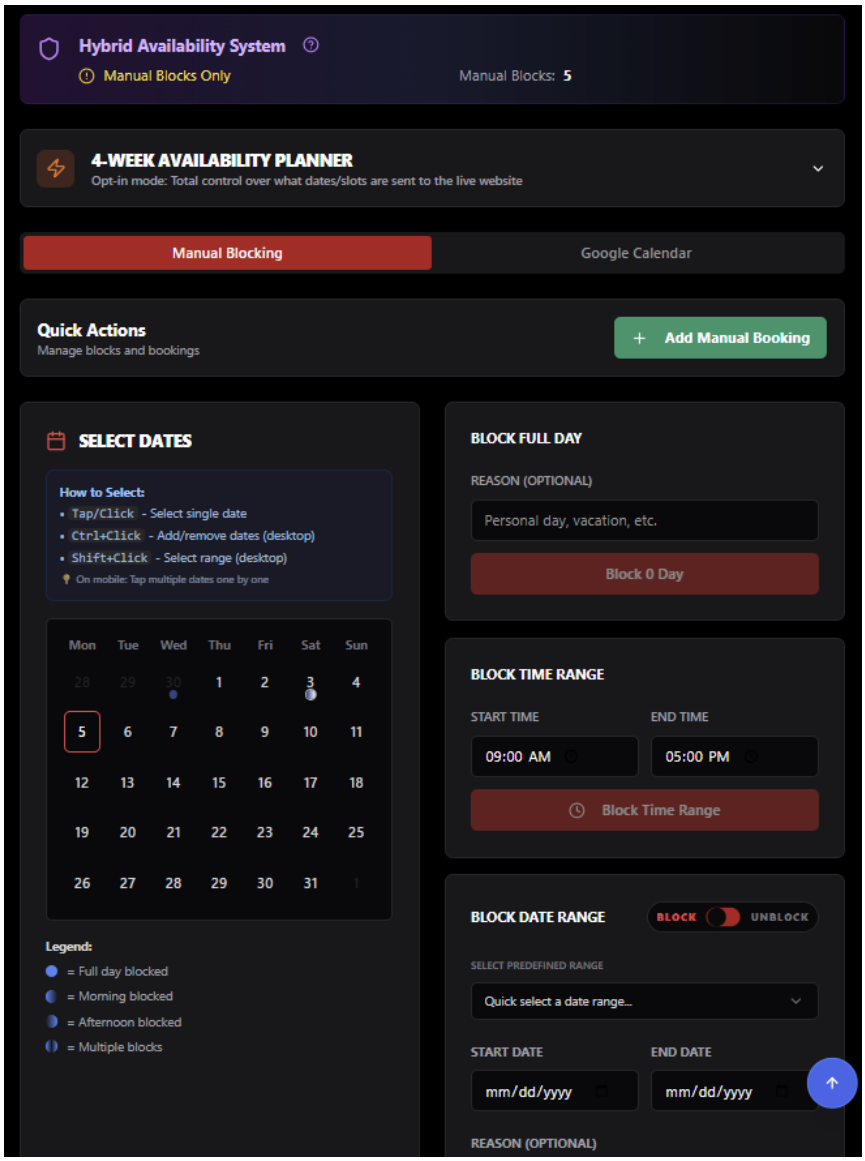

KEY FEATURES

- Full appointment detail: customer, vehicle, package, add-ons, location
- Central calendar view for daily, weekly, and monthly workload

Hybrid Availability System

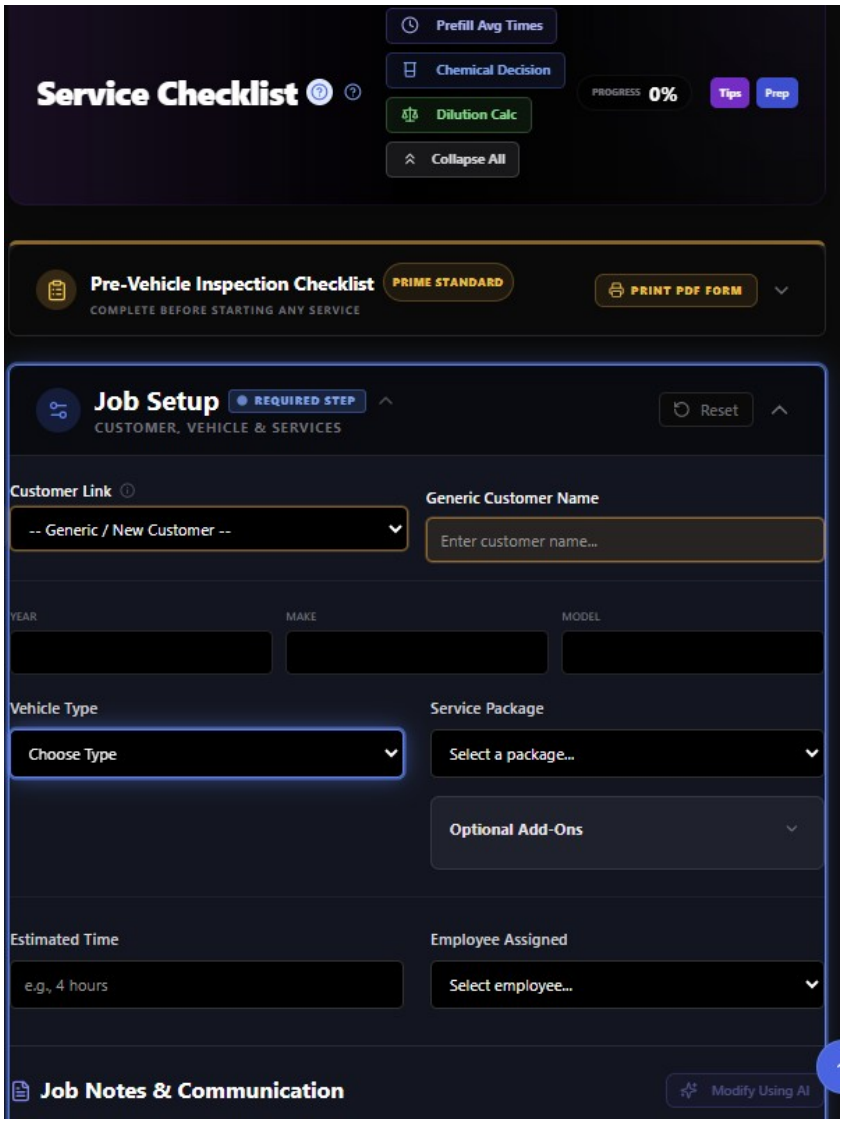

A genuinely sophisticated three-layer scheduling engine designed to prevent double-bookings and scheduling conflicts before they happen. It combines a live Google Calendar OAuth sync (so personal or external commitments block availability automatically), recurring shop holiday and closure rules (so days off don't need to be blocked manually every year), and manually 'painted' admin time blocks for anything that doesn't fit the other two categories — all with sync health badges so you can see at a glance whether the Google Calendar connection is actually working.

KEY FEATURES

- Live two-way Google Calendar OAuth sync
- Recurring shop closure and holiday rules, set once
- Manual admin time-block painting for one-off exceptions
- Sync health indicators to catch connection issues early

Service Checklist

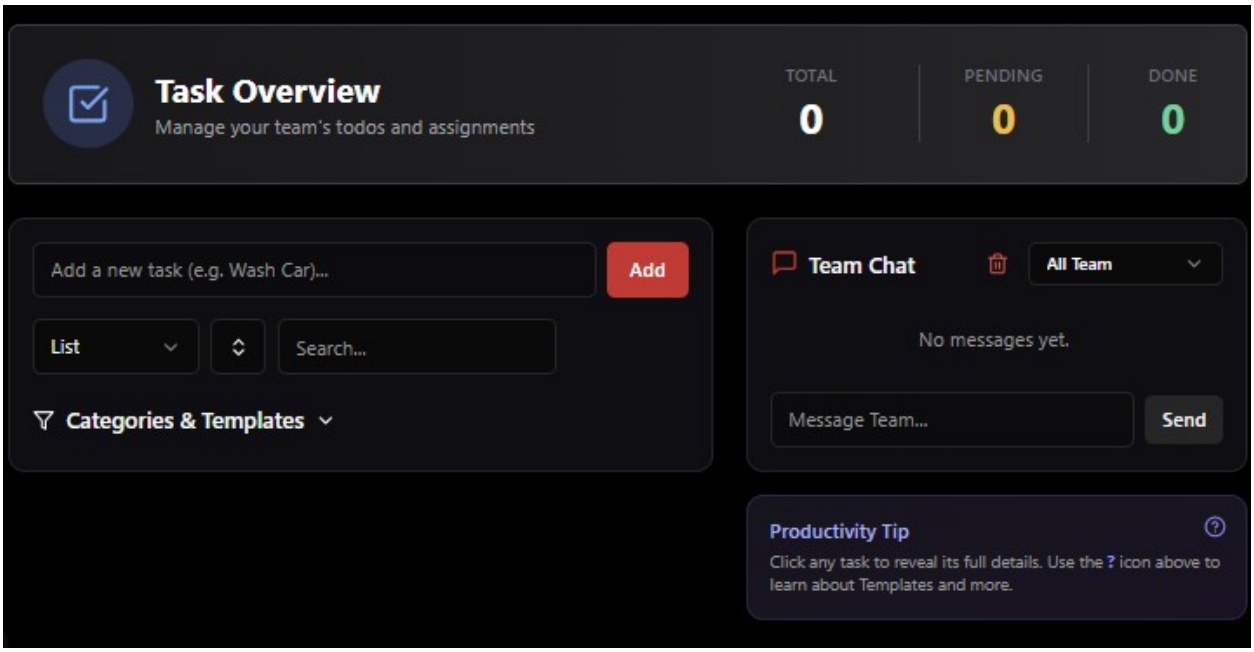

The tool technicians actually use while physically performing a job — a structured, step-by-step checklist tailored to the specific vehicle and package being serviced, tracking real elapsed time as work happens. Beyond keeping the job on track, it creates a permanent, timestamped record of exactly what was done, which becomes valuable both for quality control and for resolving any later question about what was or wasn't included in a service.

KEY FEATURES

- Step-by-step checklist tailored to vehicle and package type
- Real-time elapsed time tracking per job
- Creates a permanent audit trail for quality control and dispute resolution

Tasks

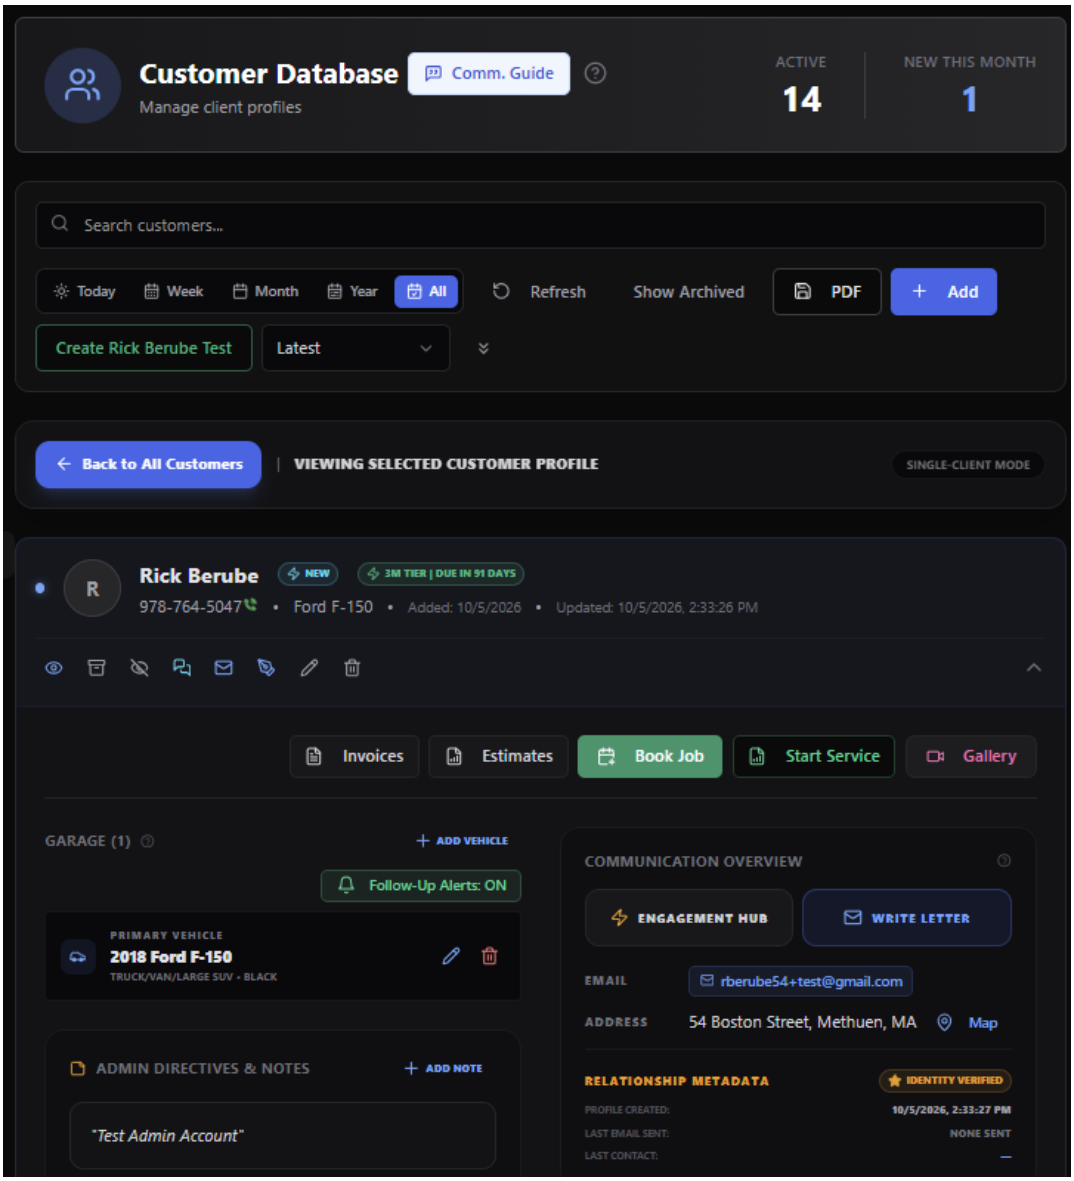

A running, shared list of shop tasks and reminders — anything from 'restock Purple X' to 'follow up with a supplier' to a one-off reminder that doesn't belong anywhere else in the system. It's the catch-all for the small operational details that keep a shop running smoothly but don't warrant their own dedicated feature.

KEY FEATURES

- Shared running list for shop tasks and reminders
- Catch-all for operational details outside other dedicated tools

Customer Profiles

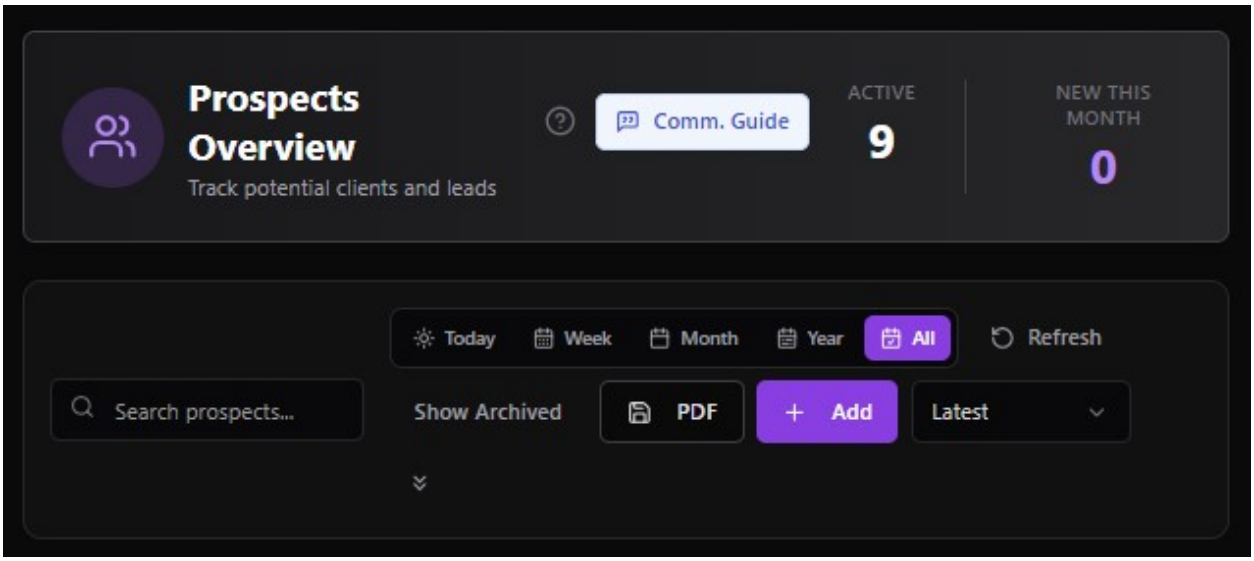

A fully searchable database of every customer who has ever interacted with the business — their complete service history, every vehicle on file, communication history, and any notes staff have added over time. This is the go-to screen any time a returning customer calls and you need their history at your fingertips instantly.

KEY FEATURES

- Full-text search across the entire customer base
- Complete service history and vehicle records per customer
- Staff notes and communication history in one place

Prospects

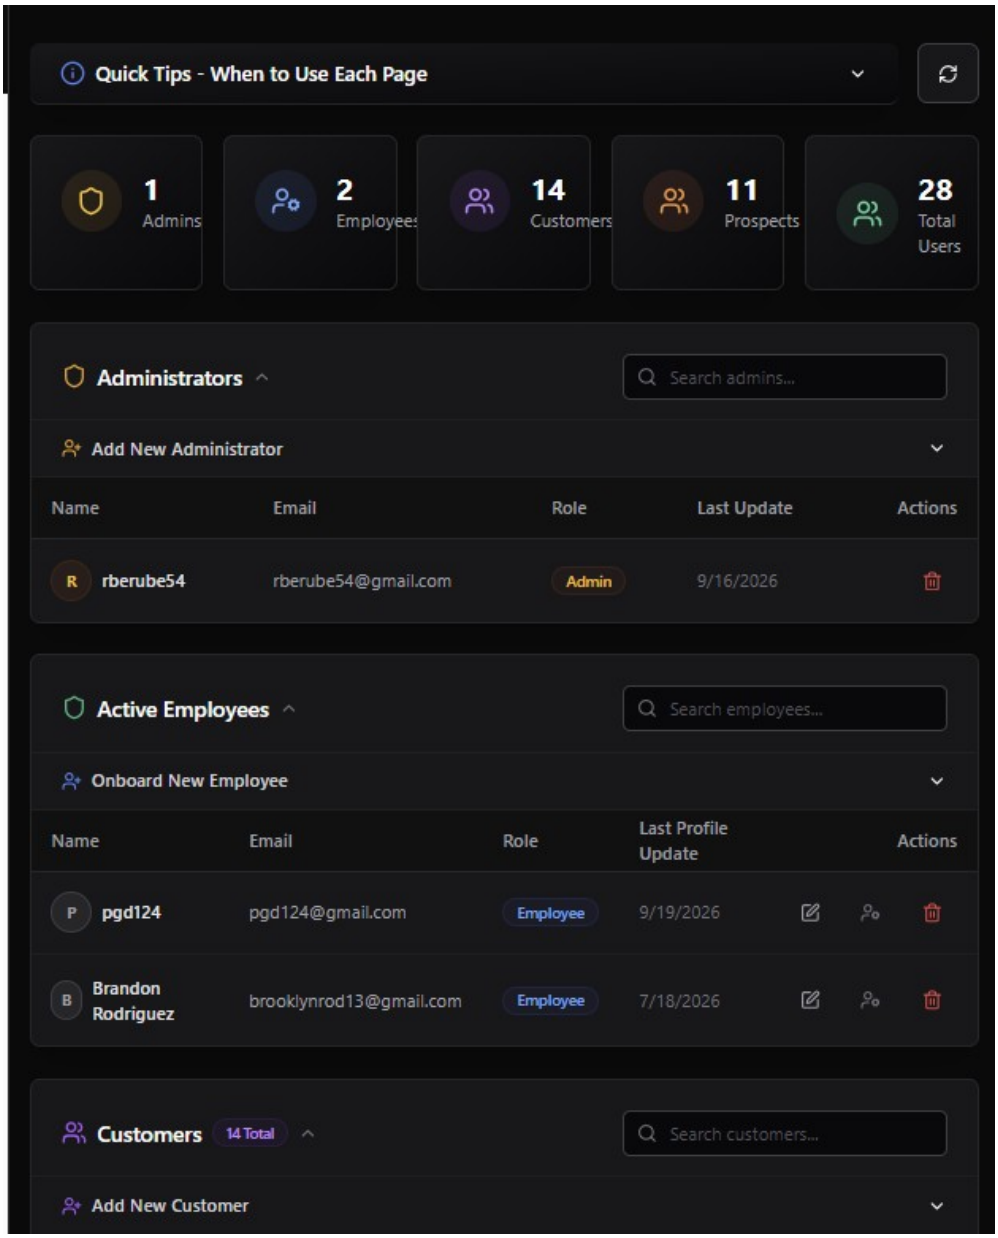

Tracks everyone who has shown genuine interest but hasn't yet become a paying customer — separate from the full customer database, so leads don't get lost in a sea of people who have already booked. Each prospect's stage in the follow-up pipeline is visible here, feeding directly into the Follow-Up Center's retention and outreach system.

KEY FEATURES

- Dedicated pipeline separate from converted customers
- Feeds directly into Follow-Up Center retention logic

Users & Roles

The access-control backbone of the entire platform — every person who touches the system, whether admin, employee, or customer, has their permissions defined and managed from here. This is what ensures an employee can see their own schedule and job details without being able to touch payroll or business accounting, and that a customer only ever sees their own account.

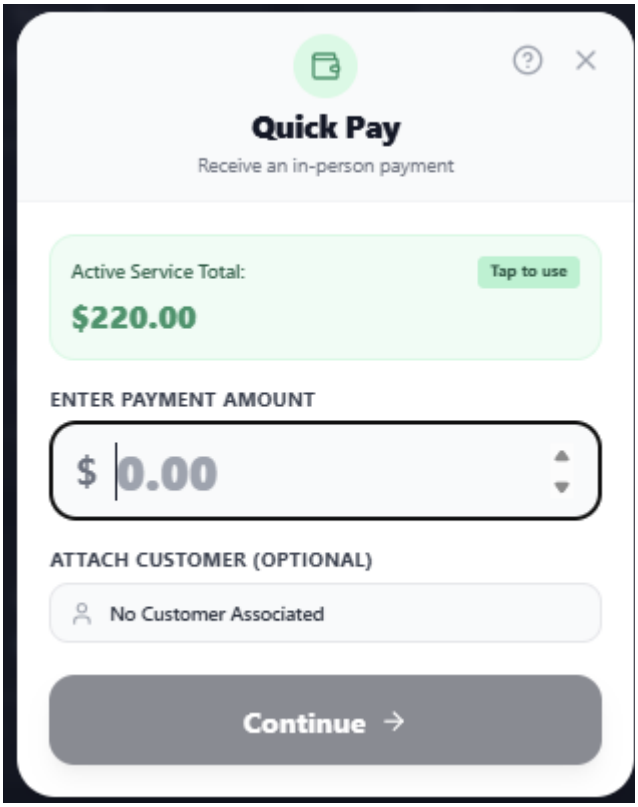

KEY FEATURES

- Role-based permissions: Admin, Employee, Customer
- Single control point for every user's access level

FINANCE & SALES

12 feature pages in this category

Quick Pay

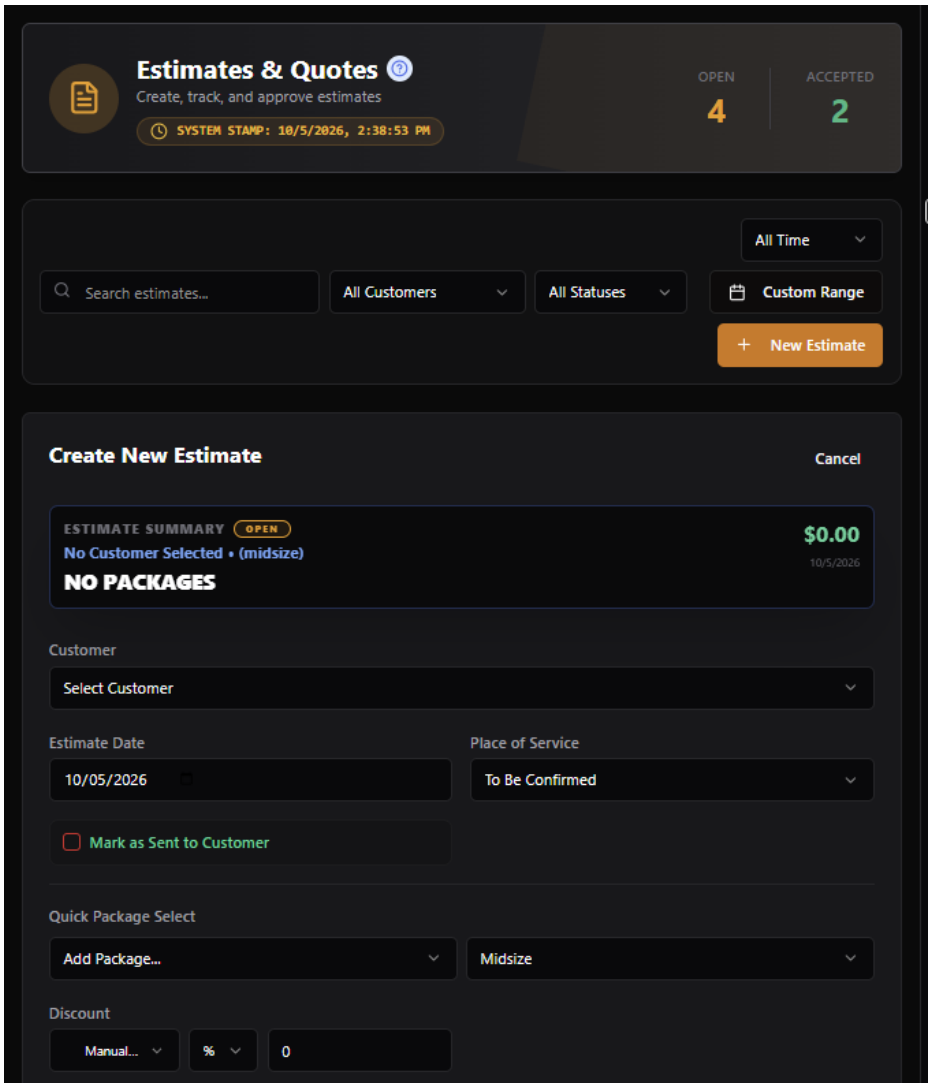

A fast, no-frills way to collect payment on the spot at the end of a job, without the overhead of generating a full formal invoice first. It exists for the common real-world scenario of finishing a job and simply needing to get paid right then, especially for smaller or one-off jobs where a full invoice workflow would be overkill.

KEY FEATURES

- Immediate in-person payment collection
- No invoice generation required for simple transactions

Estimates

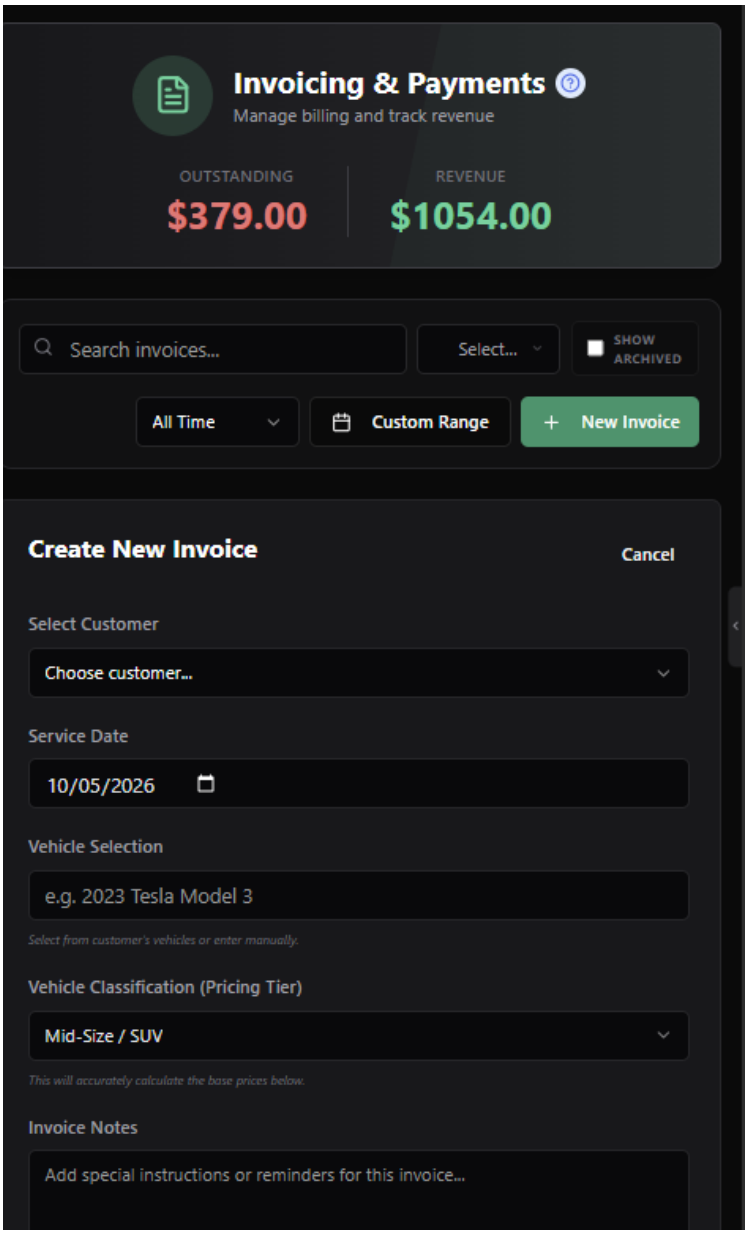

A genuinely powerful estimate-building tool that goes well beyond a simple price quote. Estimates can include section headers to organize complex jobs, per-vehicle discount rows for multi-vehicle quotes, and a Compare Scenarios feature that shows a customer two or more pricing options side by side (for example, with and without a specific add-on) so they can make an informed choice rather than being handed one flat number. Every estimate can be sent as a shareable public link, which the customer can accept or decline directly — and that decision now flows back live into both the Estimates list and the Analytics dashboard the moment it happens.

KEY FEATURES

- Section headers and per-vehicle discount rows for complex, multi-vehicle quotes
- Compare Scenarios: real side-by-side pricing options for the customer
- Shareable public acceptance link with live status tracking
- Status filters: Not Received, Sent, Accepted, Declined, plus an All reset

Invoicing

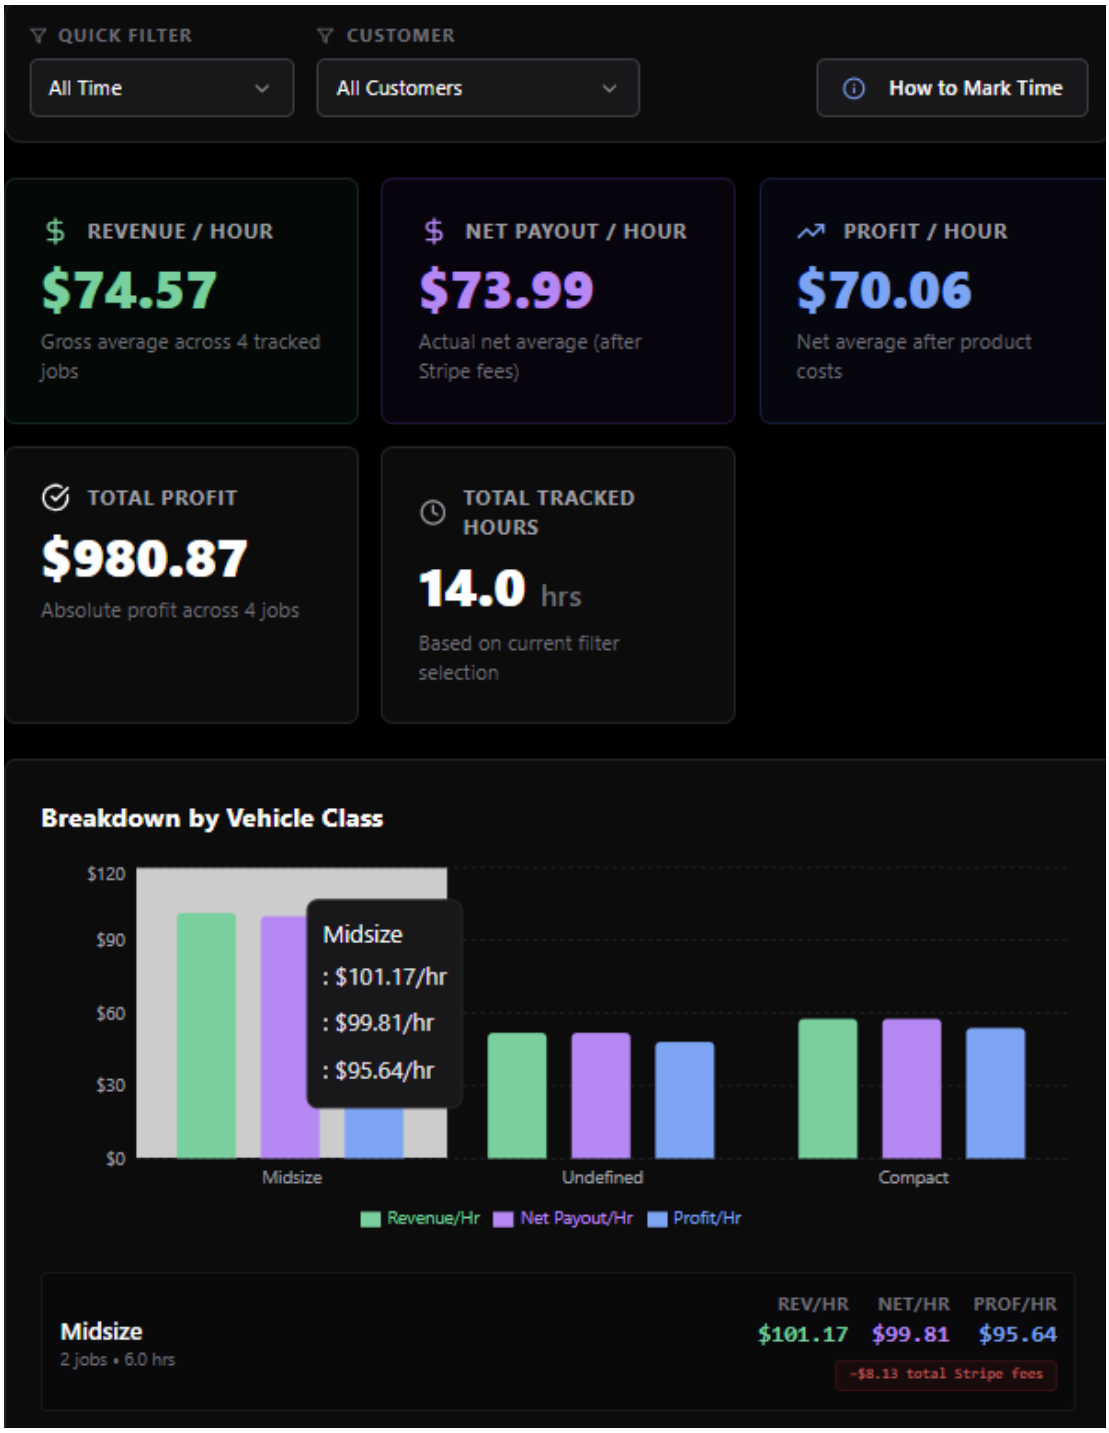

Where completed jobs become formal, payable invoices — including a hosted, customer-facing payment portal that lets a client pay online without needing to be physically present or call in a card number. Paid, Unpaid, and Overdue status tracking keeps outstanding balances visible at a glance, rather than requiring a manual scan through every invoice to find what's still owed.

KEY FEATURES

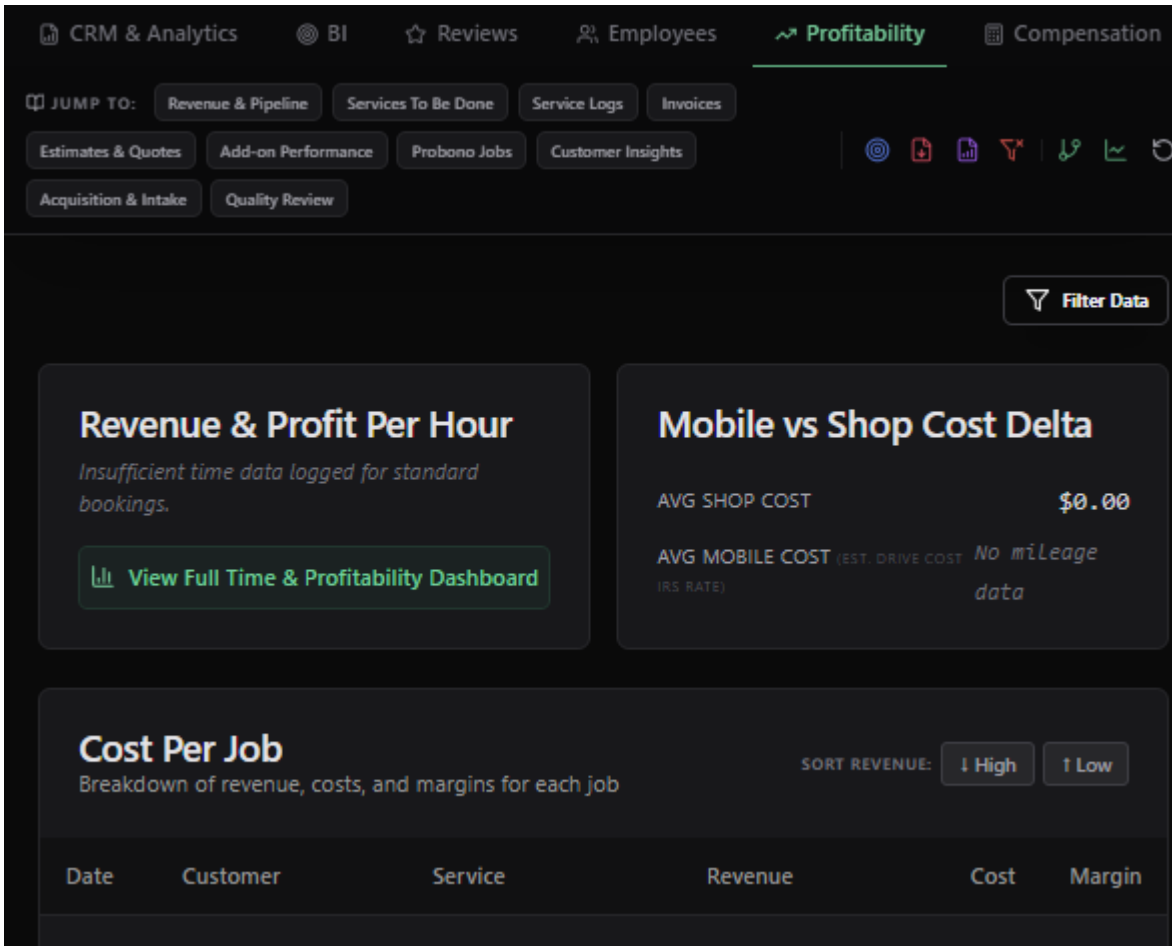

- Hosted customer-facing payment portal (card/Apple Pay)
- Paid / Unpaid / Overdue status tracking
- Direct link to Payments and Accounting for a full financial picture

Time & Profitability

The same Time & Profitability dashboard described under Main, made directly accessible from the Finance & Sales menu for quick reference in the middle of a pricing conversation or decision — no need to navigate away from financial tools to check it.

Market Pricing Analysis

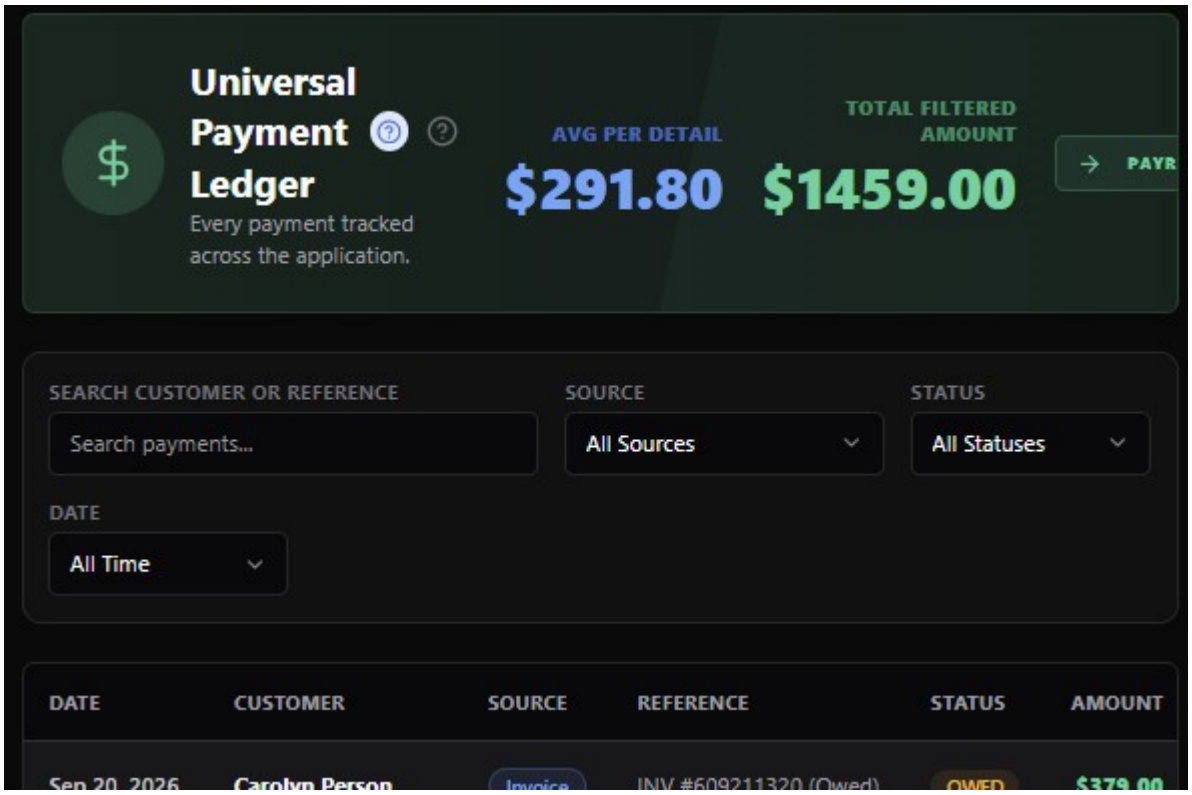

A focused sub-view within the Profitability tab that benchmarks your own pricing against typical market rates for comparable services in the area. It's a reality check tool — helping confirm whether a price increase is justified by the market, or whether a package is already priced out of line with what competitors charge.

KEY FEATURES

- Direct comparison of your pricing against typical market rates
- Supports informed, data-backed pricing decisions

Payments

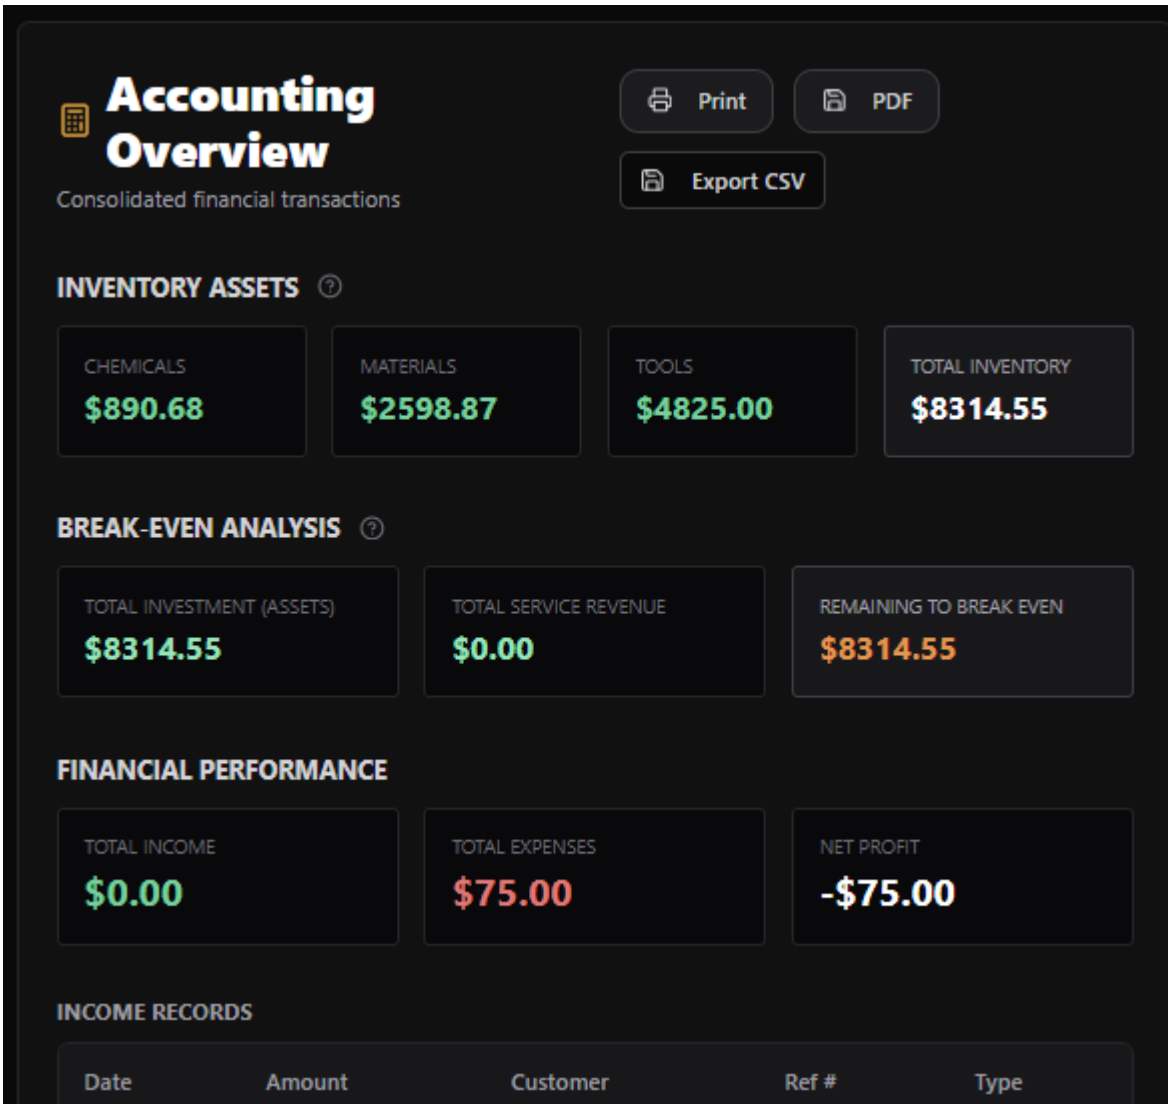

A unified record of every payment the business has received, regardless of which channel it came through — Quick Pay, a hosted invoice portal, or a manually logged payment. Having every payment in one place, rather than scattered across separate systems per payment method, makes reconciliation and reporting dramatically simpler.

KEY FEATURES

- Single unified log across all payment channels
- Simplifies reconciliation against invoices and accounting

Accounting

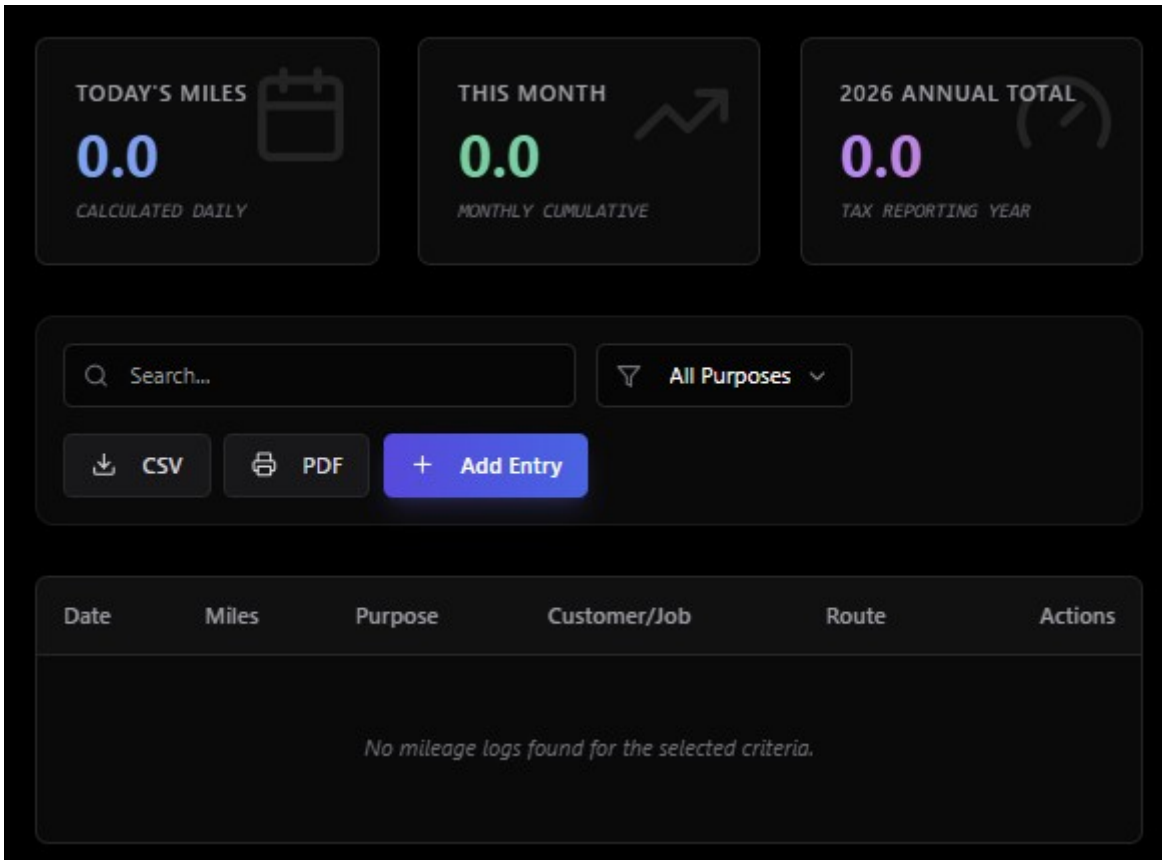

The full financial picture of the business — income and expenses, organized into categories, giving a real view of profitability at the business level rather than just the per-job level. This is the screen used for bigger-picture financial health checks, not day-to-day job pricing.

KEY FEATURES

- Full income and expense categorization
- Business-level financial health view, distinct from per-job profitability

Mileage

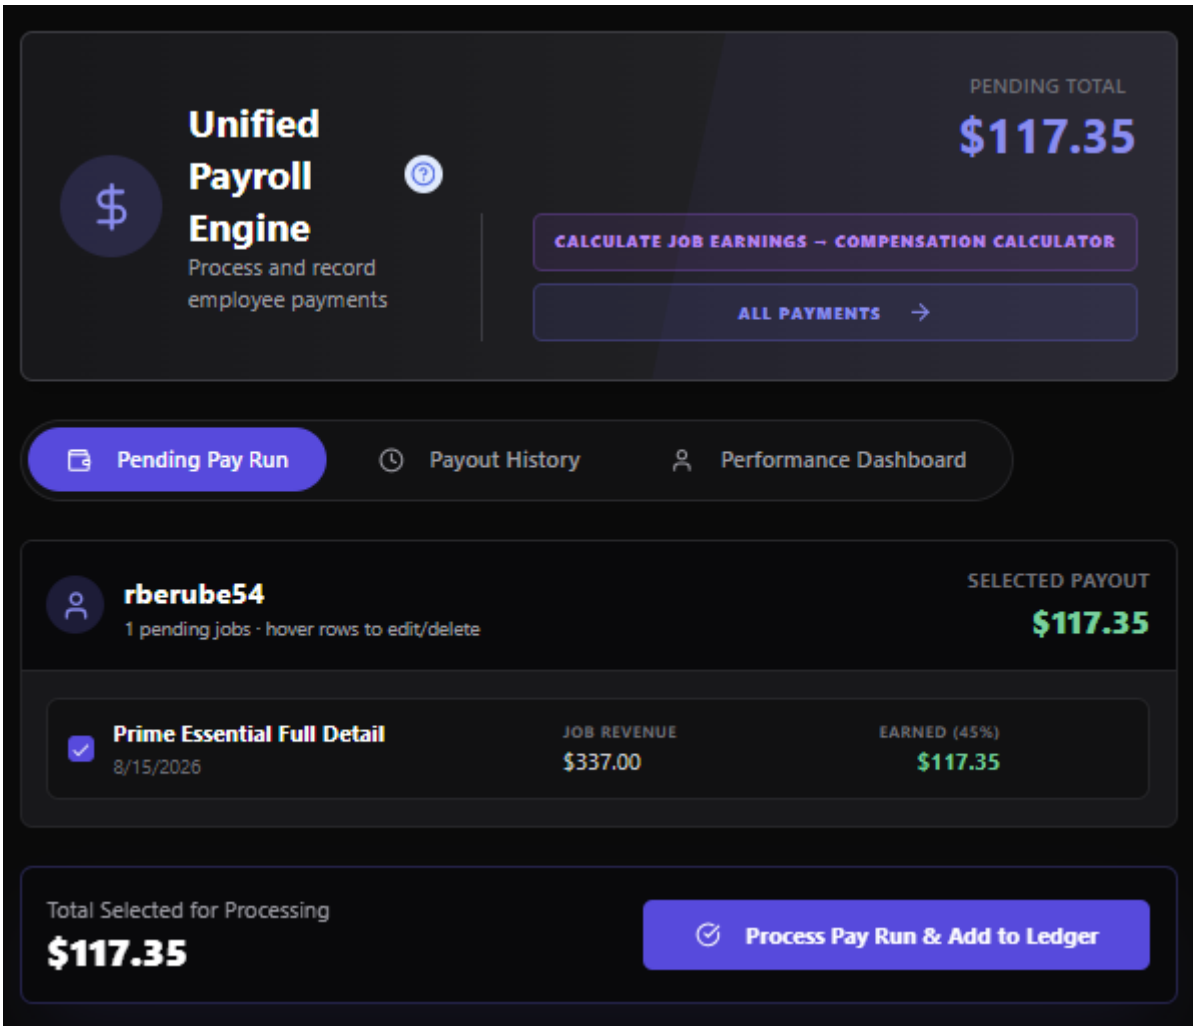

A dedicated tracker for mobile-job mileage, supporting accurate business expense records and tax deductions that a business running any real volume of mobile work genuinely benefits from documenting properly rather than estimating at tax time.

KEY FEATURES

- Per-job mileage logging for mobile work
- Supports accurate tax deduction documentation

Payroll

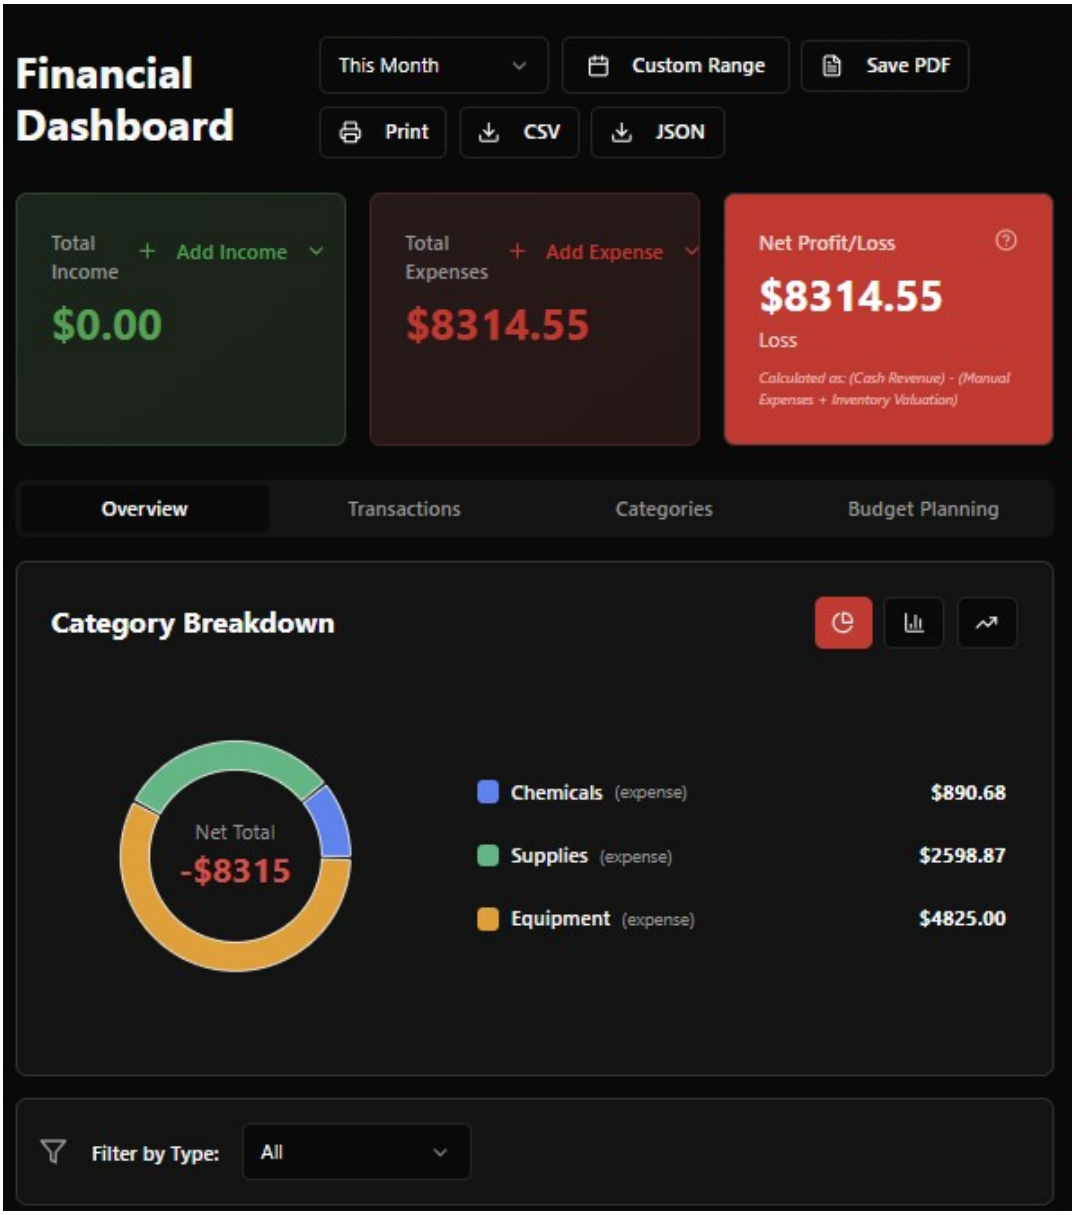

A genuinely complete three-phase payroll engine, including multi-state tax compliance (built specifically for operating across state lines, such as New Hampshire and Massachusetts) and pay-by-job piece-rate compensation calculations for technicians — meaning staff are paid based on the jobs they actually complete rather than a flat hourly rate alone.

KEY FEATURES

- Three-phase payroll processing engine
- Multi-state tax compliance built in
- Pay-by-job (piece-rate) compensation support alongside standard wages

Company Budget

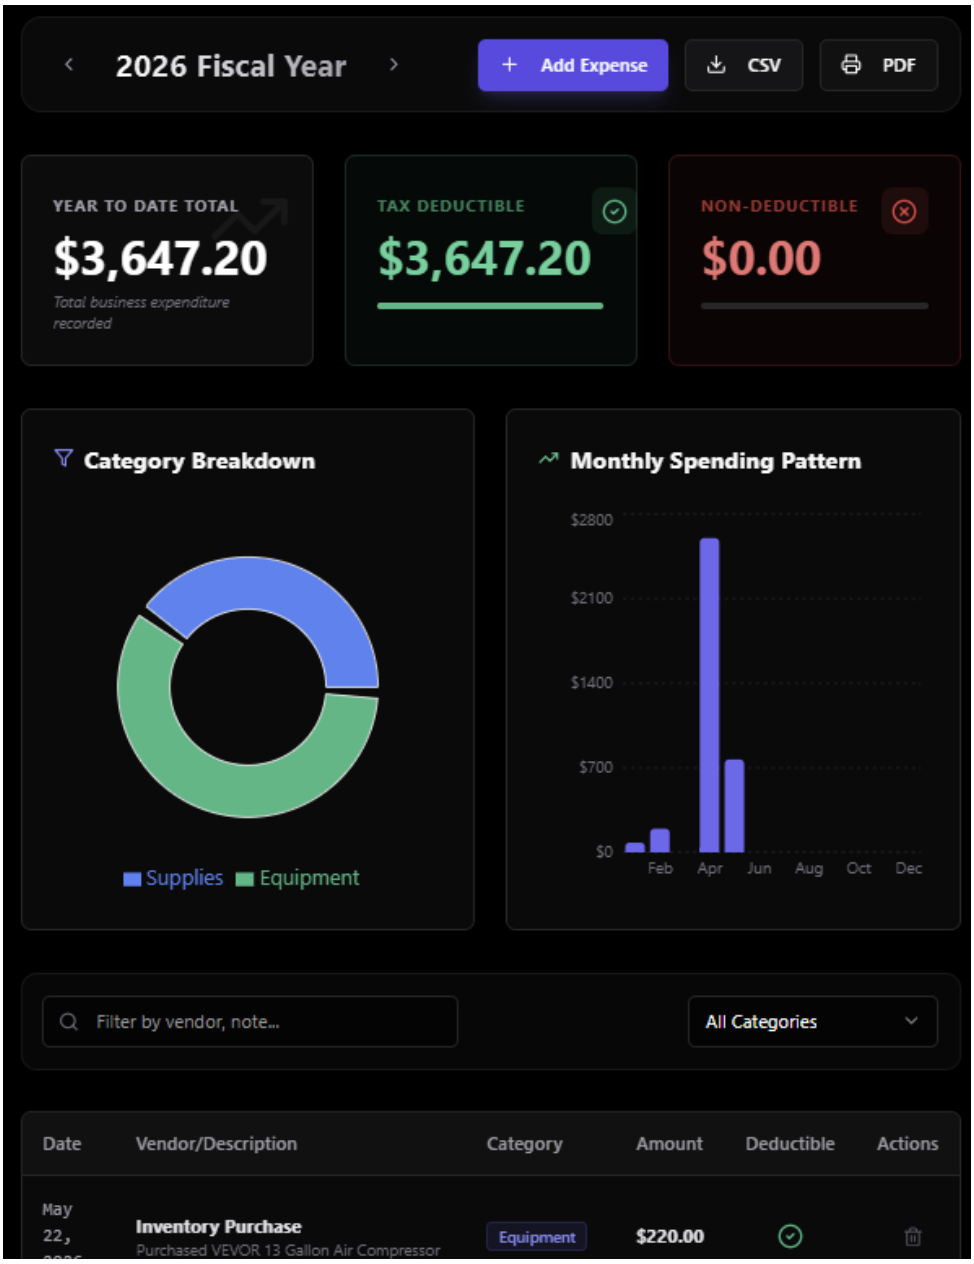

A planning and tracking tool that compares what the business planned to spend, category by category, against what it actually spent — surfacing overspending or underspending trends before they become a bigger problem at year-end.

KEY FEATURES

- Planned-versus-actual spending by category
- Early visibility into budget drift before it compounds

Taxes

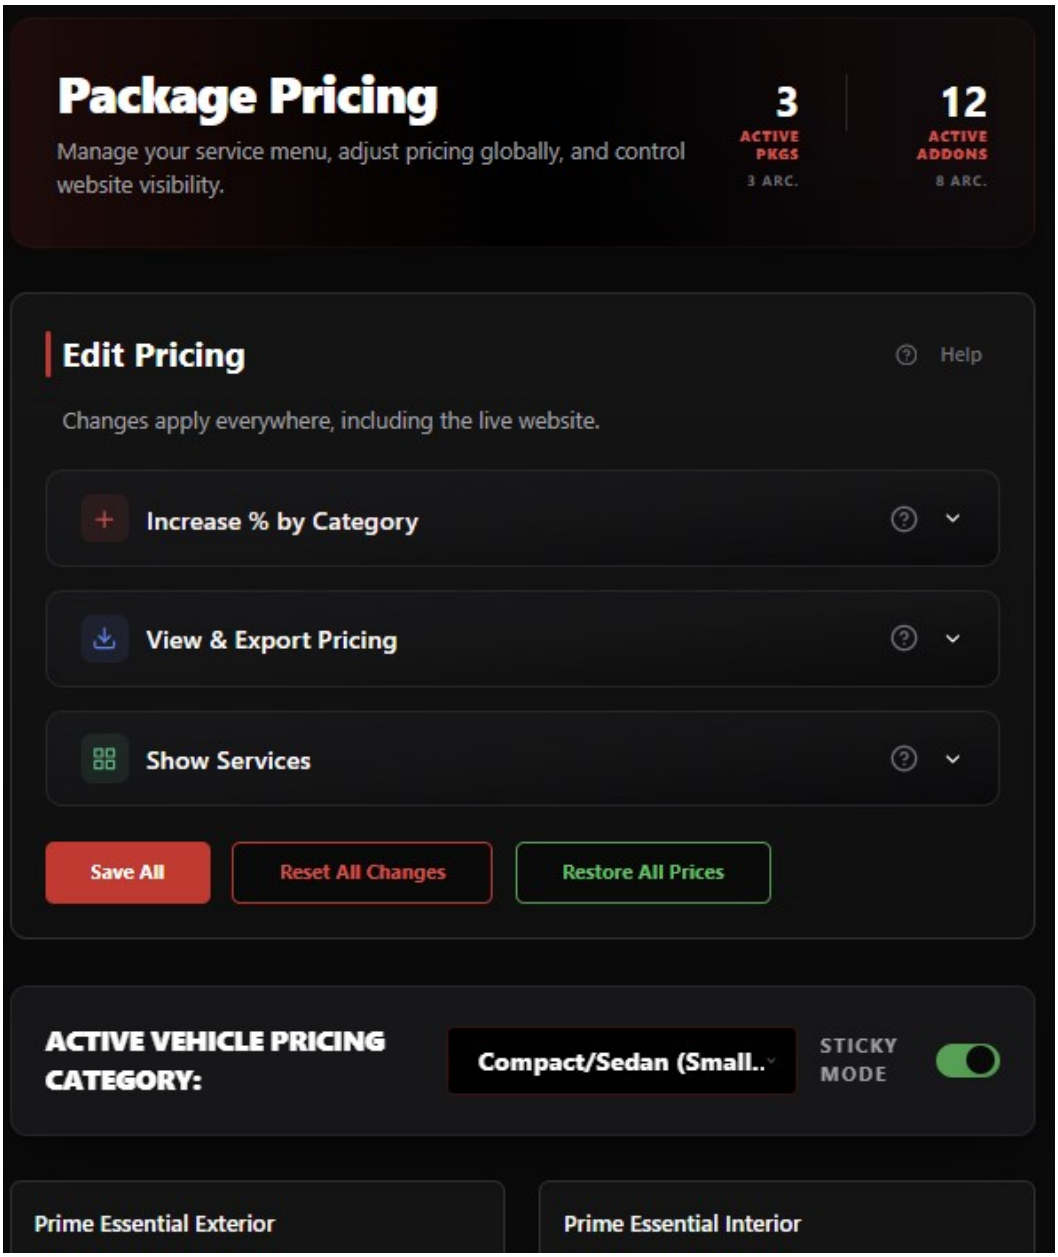

Tax preparation tools built to make filing season dramatically less painful — including sales tax summaries and records organized specifically for handing off to an accountant or filing directly, rather than reconstructing a year's worth of transactions from scratch every spring.

KEY FEATURES

- Sales tax summary generation
- Records pre-organized for filing or accountant handoff

Package Pricing

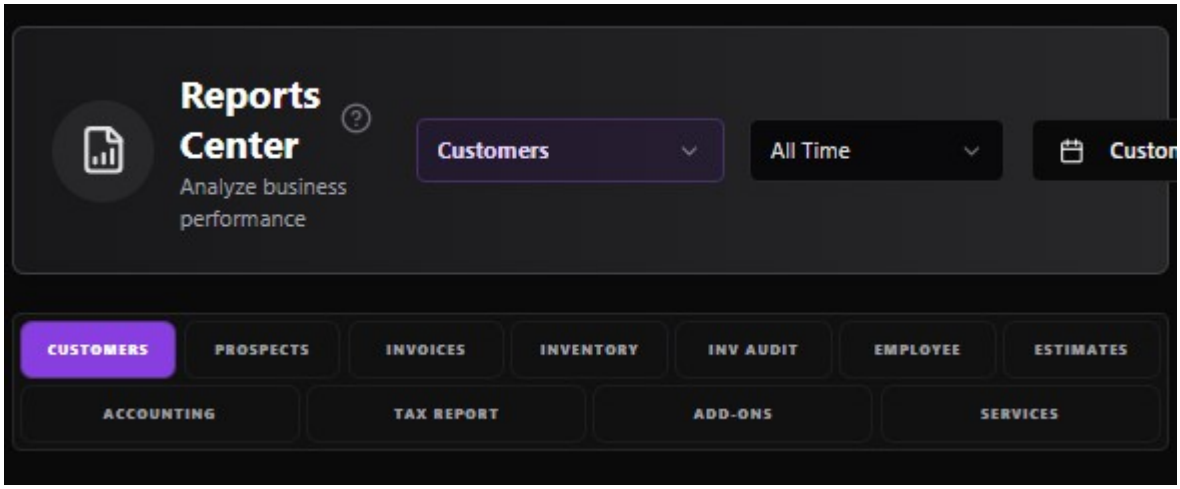

The master pricing control for every service and add-on across all four vehicle classification tiers — including the ability to archive older or discontinued offerings without deleting their historical data, so past invoices and estimates referencing them still display correctly.

KEY FEATURES

- Full pricing control across all vehicle tiers and packages
- Archive (not delete) for discontinued offerings, preserving historical accuracy

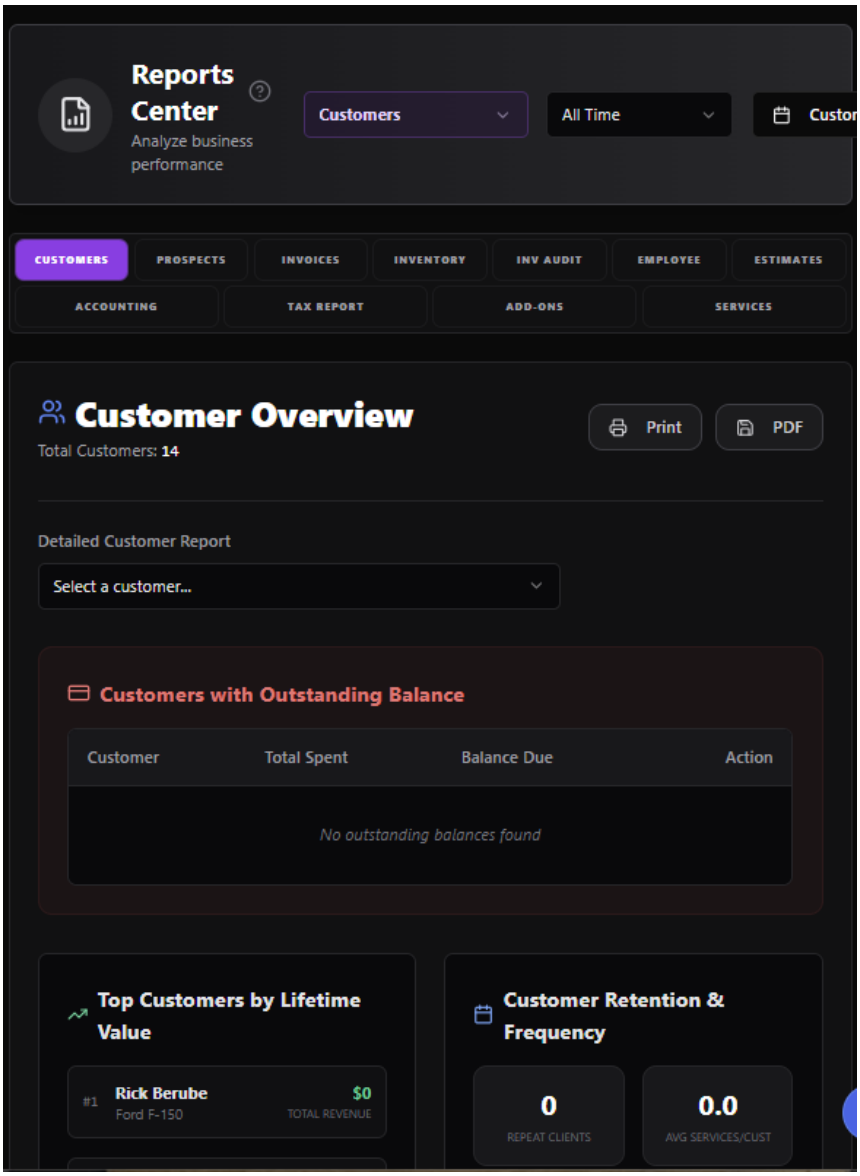

REPORTS

Reports Dashboard

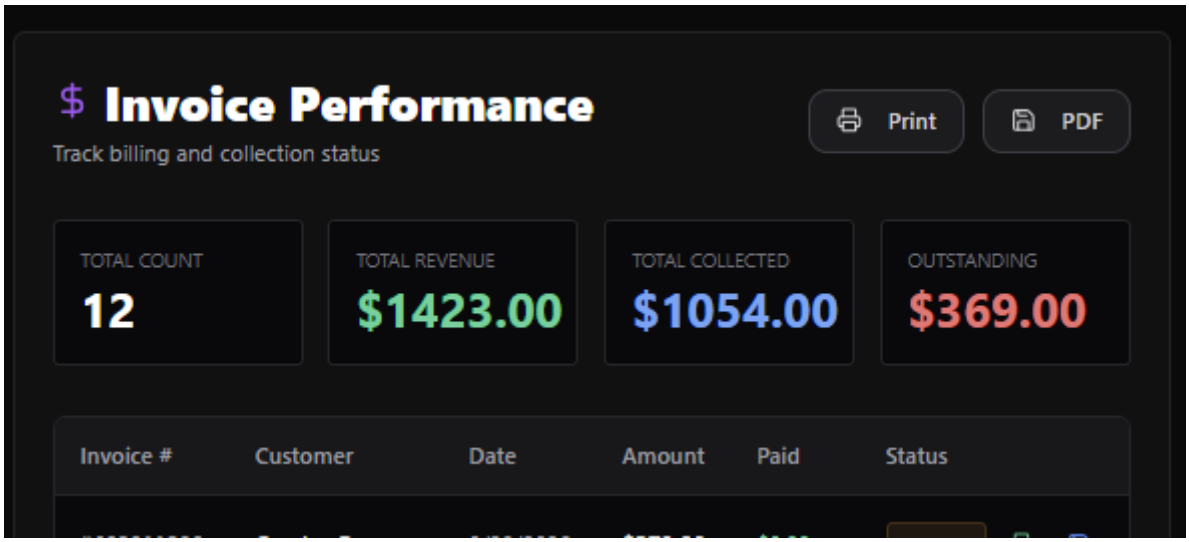

The central hub tying together every report the business generates, with dedicated tabs for each major data category so you're never digging through one enormous combined report to find the specific numbers you need.

Customers

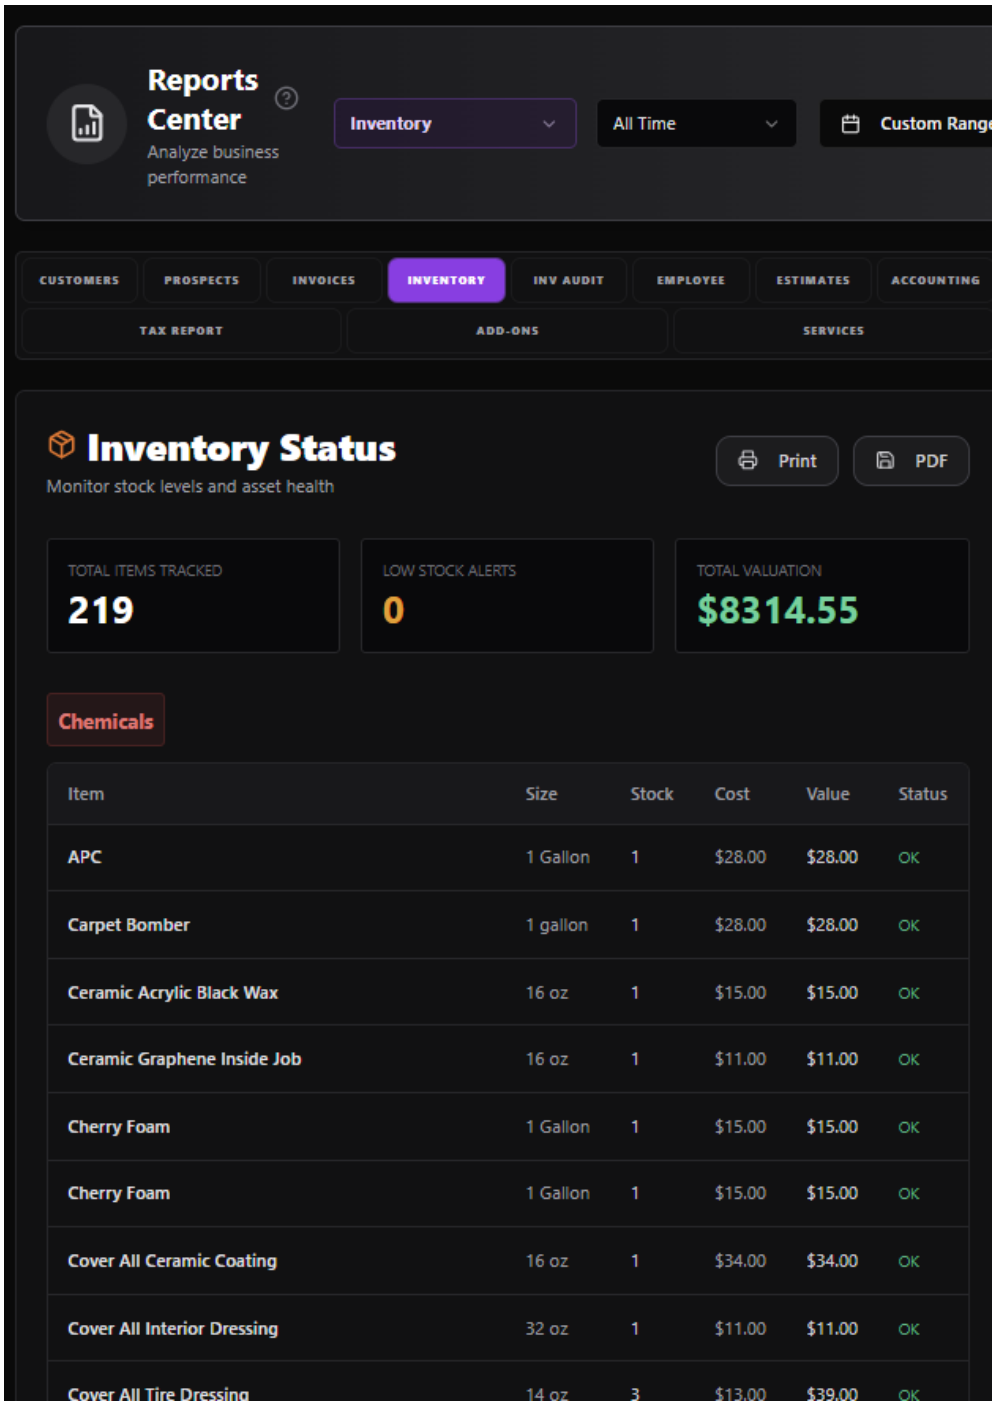

Customer-focused reporting covering lifetime value, service history patterns, and broader relationship trends across the entire customer base — useful for spotting your most valuable long-term customers versus one-time bookings.

Invoices

Invoice and payment audit reporting, tracking billing accuracy and outstanding balances over time — a good regular check to confirm nothing is falling through the cracks financially.

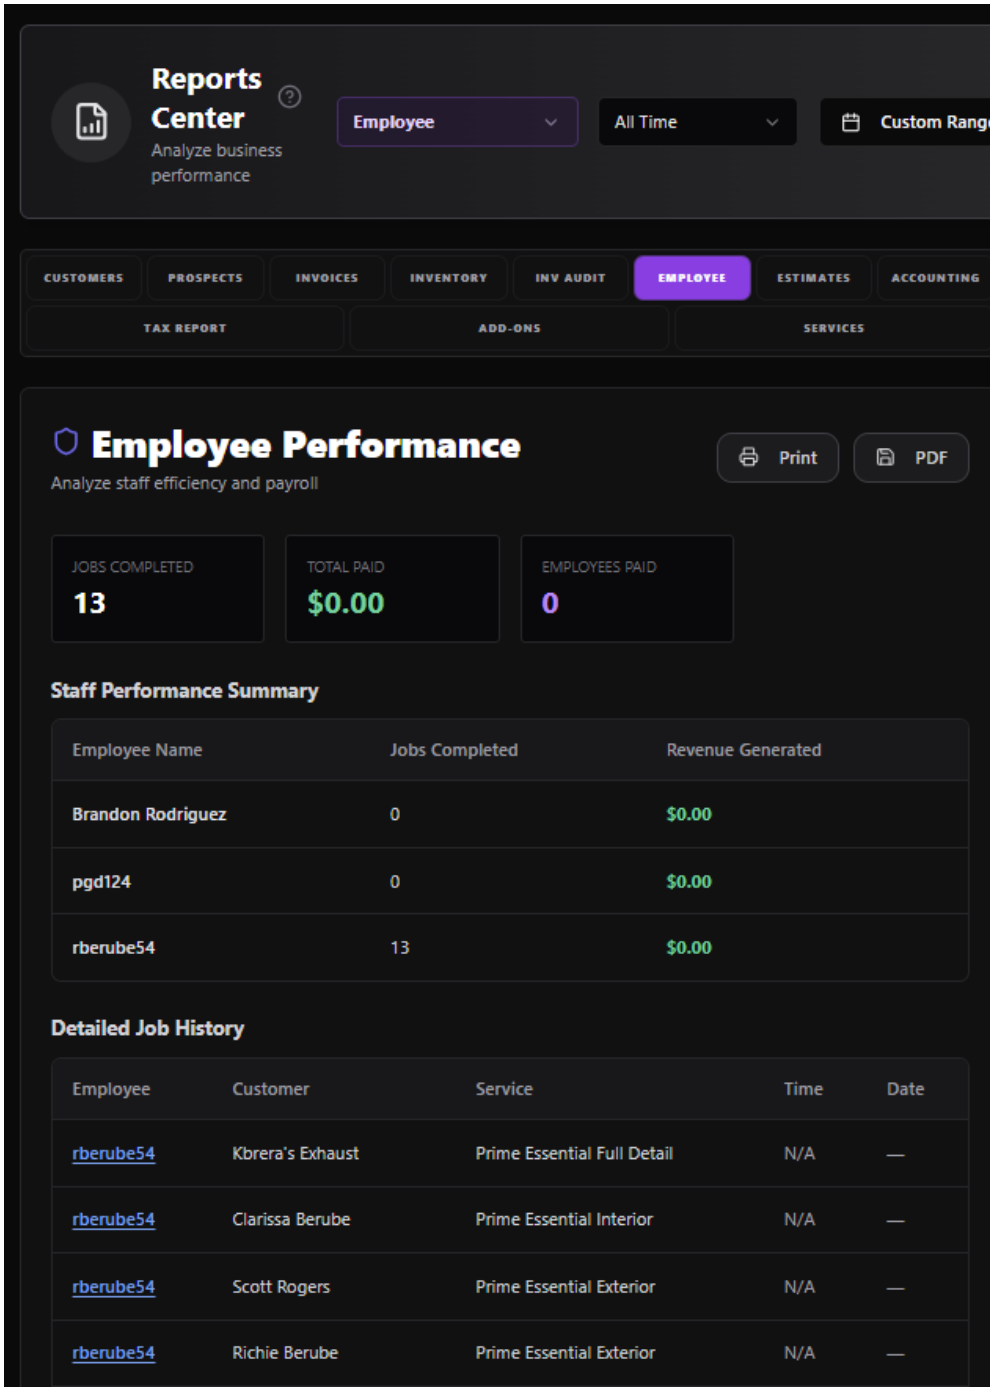

Inventory

Inventory value and usage reporting spanning chemicals, supplies, and equipment, giving a dollar-value view of what's on the shelves and how quickly it's actually being consumed.

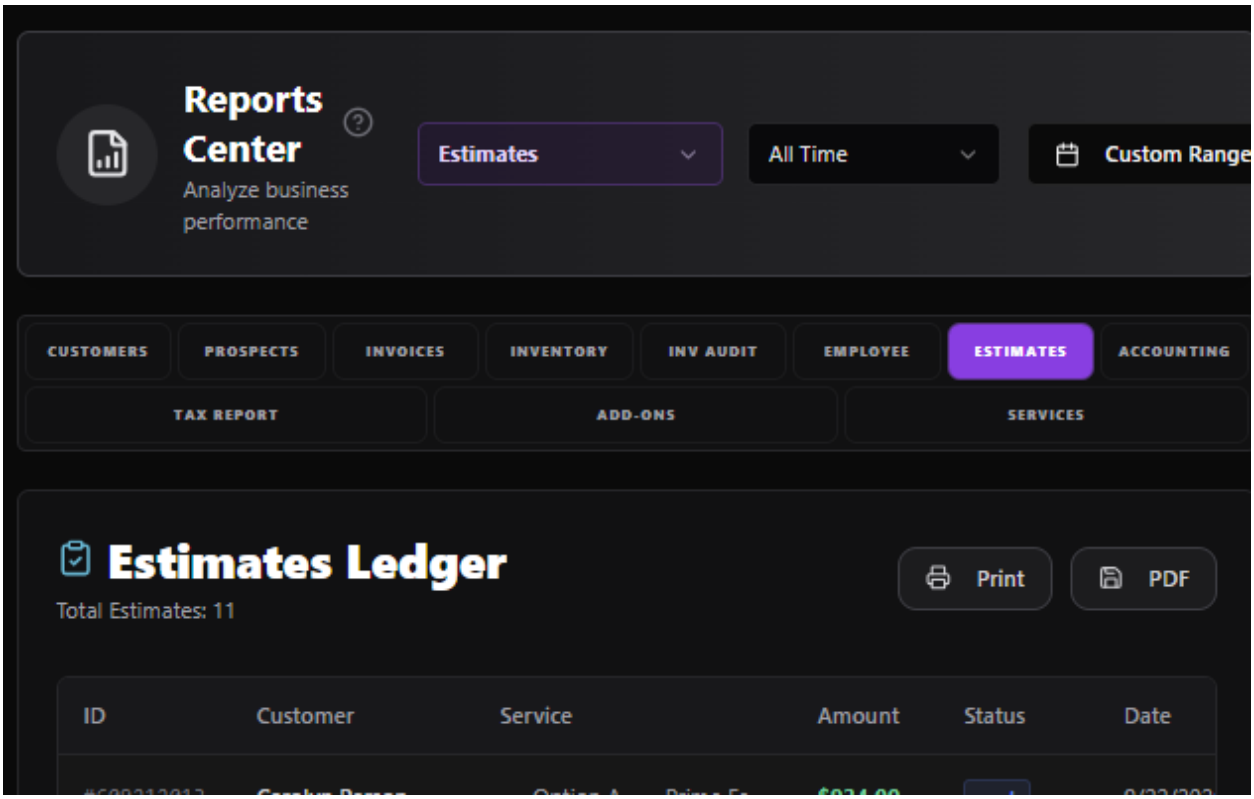

Employee

Technician and staff performance analytics, covering job completion rates and efficiency metrics — useful both for recognizing strong performers and for spotting where additional training might help.

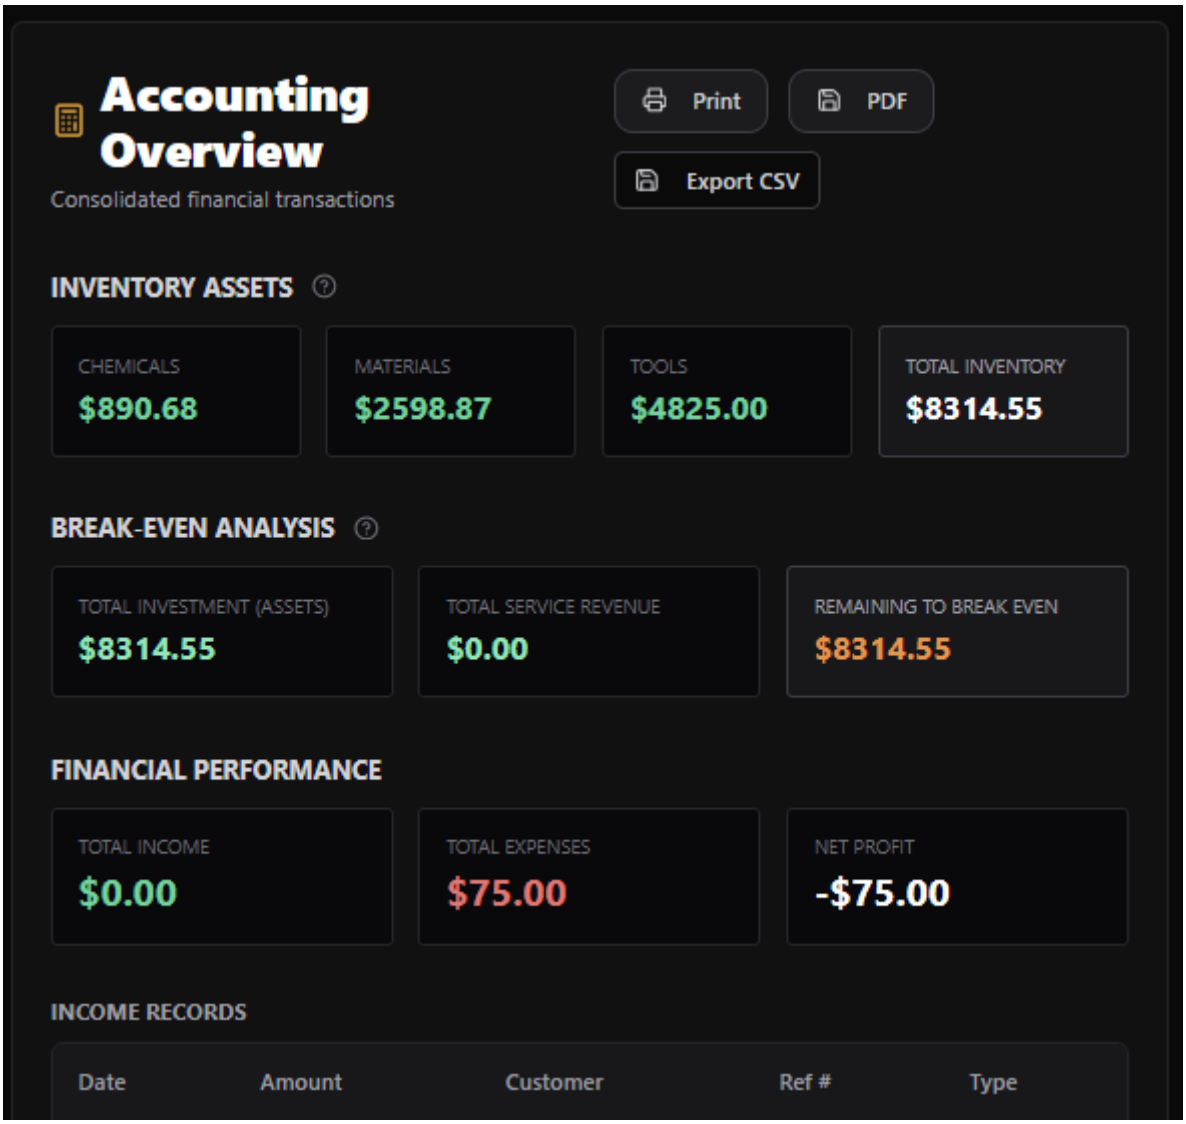

Estimates

Estimate and quote performance reporting — acceptance rates, average quote value, and conversion trends over time, helping answer whether pricing or presentation changes are actually moving the needle.

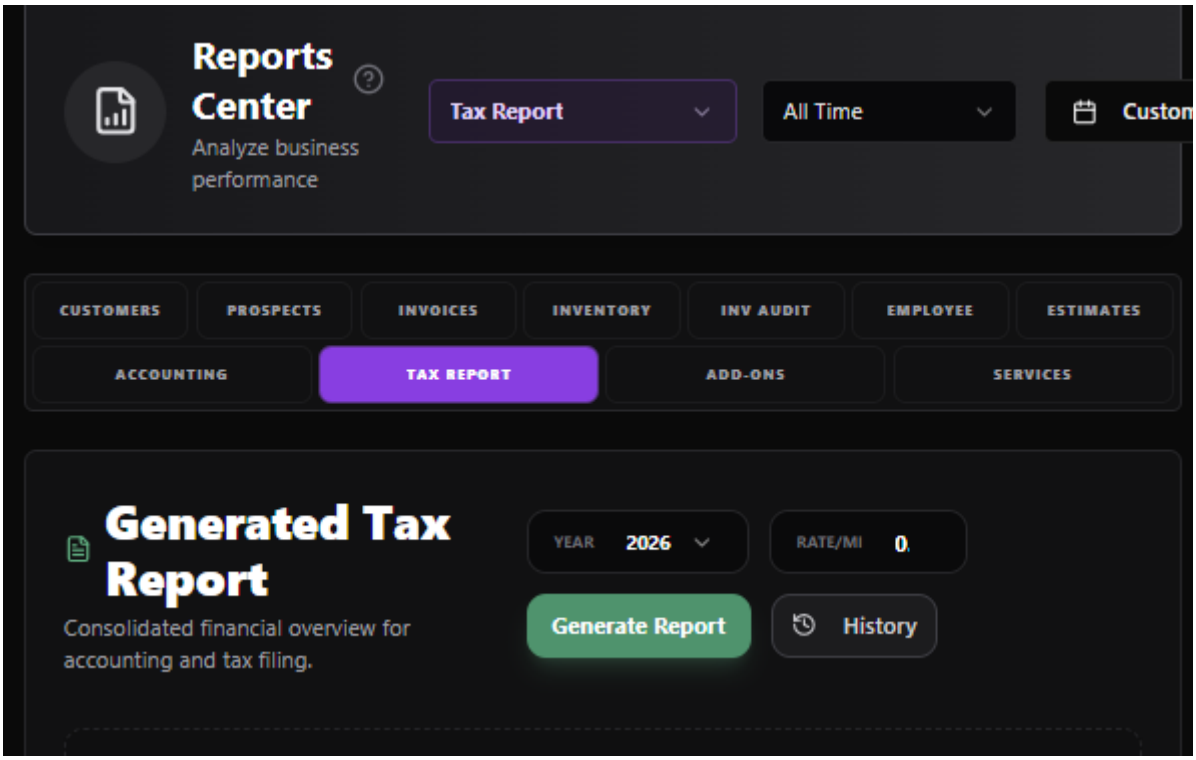

Accounting

A full, consolidated business accounting report combining income and expense data into a single formal view, suited for higher-level financial review rather than day-to-day bookkeeping.

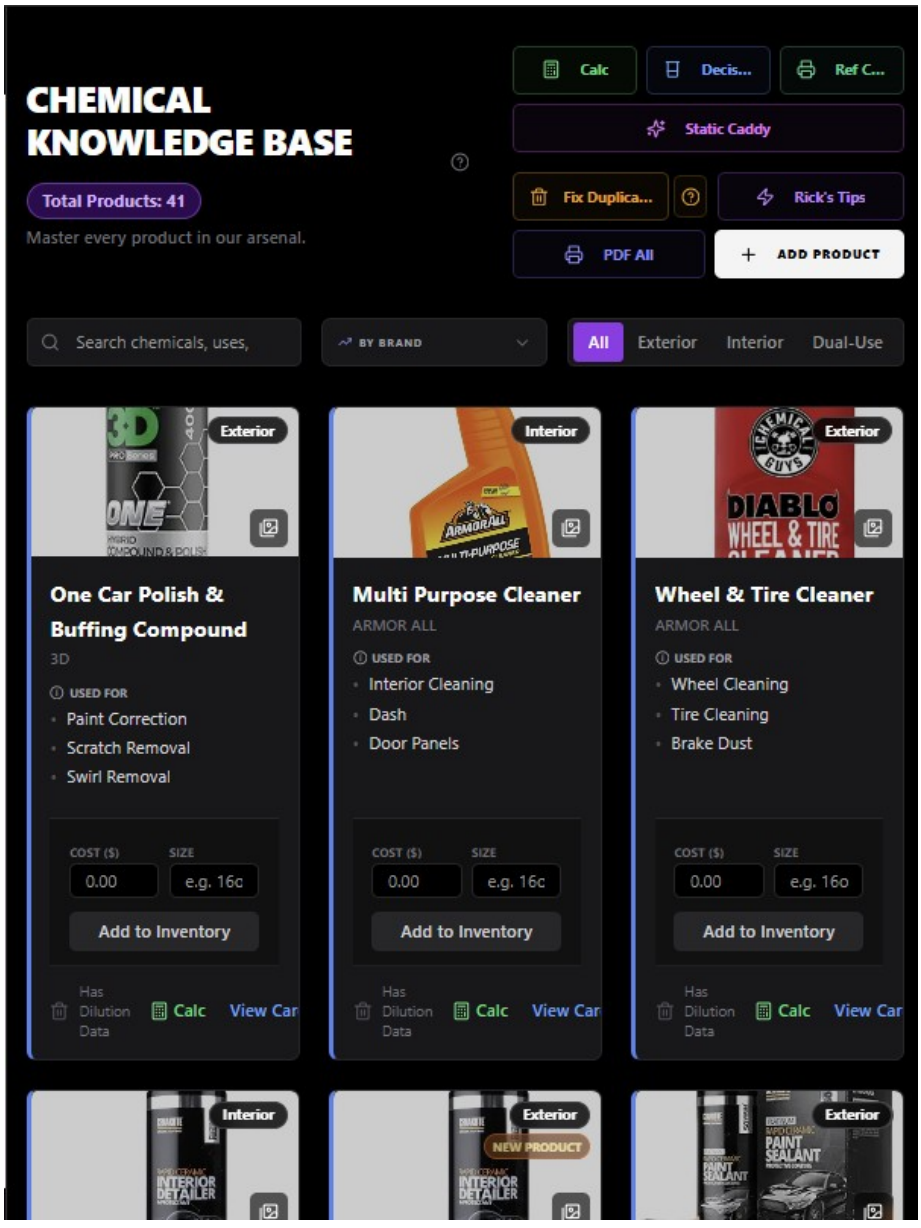

Tax Report

A tax and sales tax summary report formatted specifically for filing season and recordkeeping, pulling together the numbers an accountant or tax preparer will actually need.

CHEMICALS

7 feature pages in this category

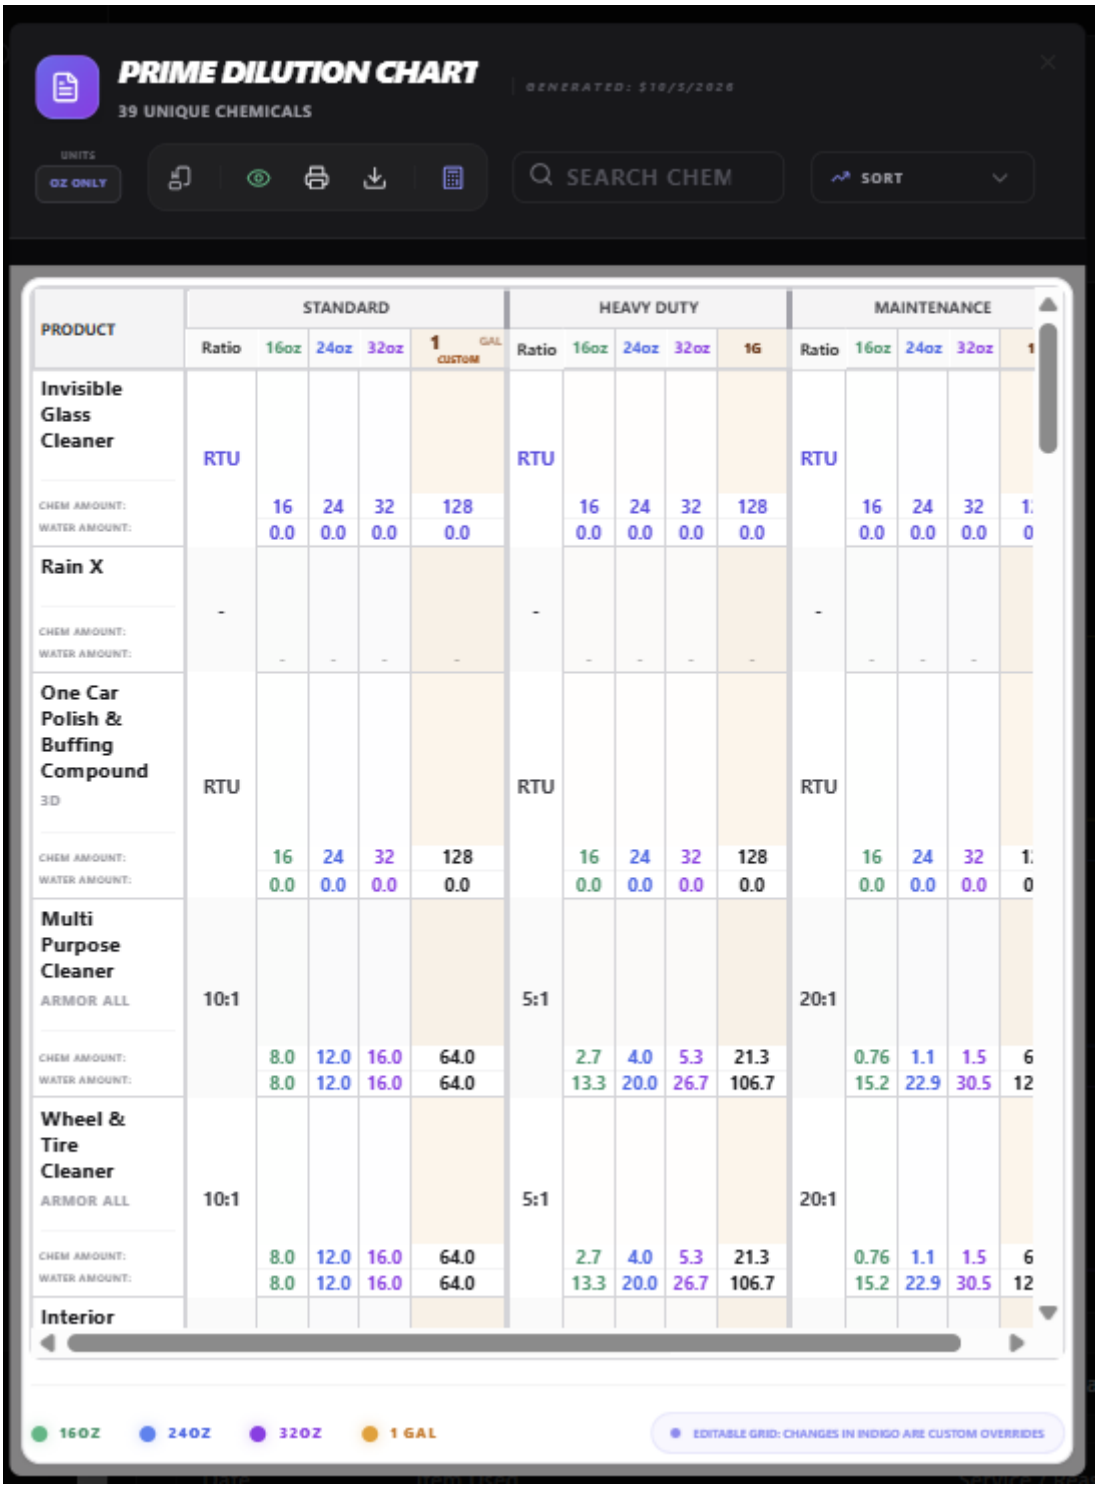

Chemical Cards

A knowledge-base view of every chemical currently in use across the business, organized for fast technician reference — what category it belongs to, what it's actually for, and any safety notes that matter before it's used on a job.

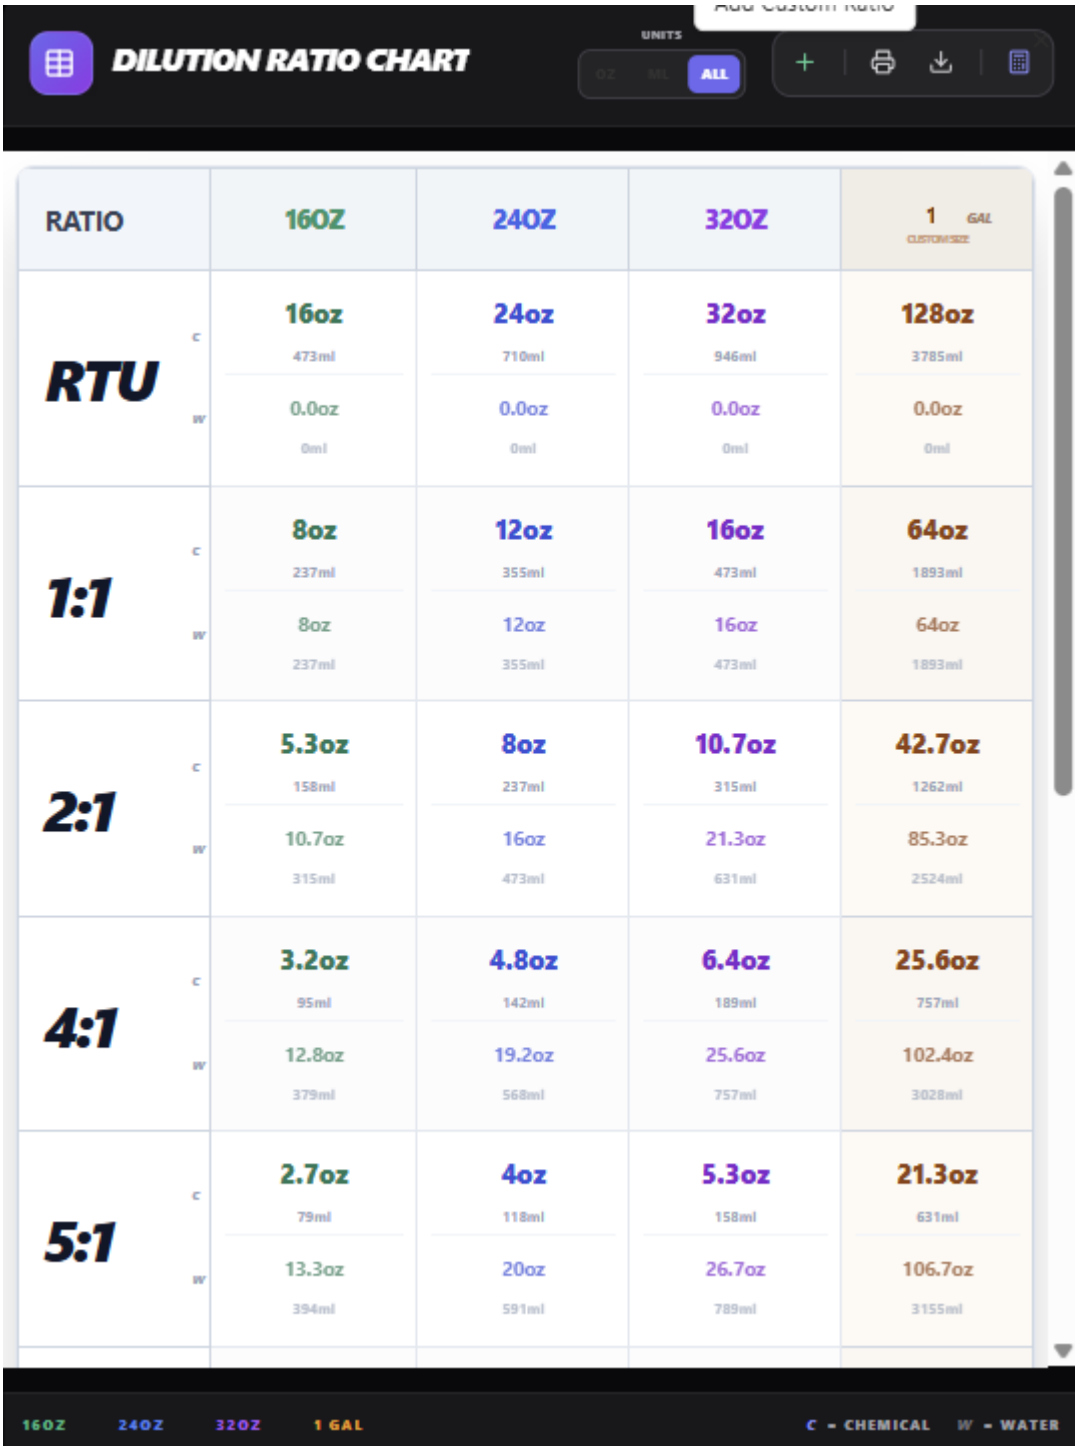

KEY FEATURES

- Quick-reference cards by chemical, not buried in a spec sheet
- Safety notes surfaced alongside purpose and category

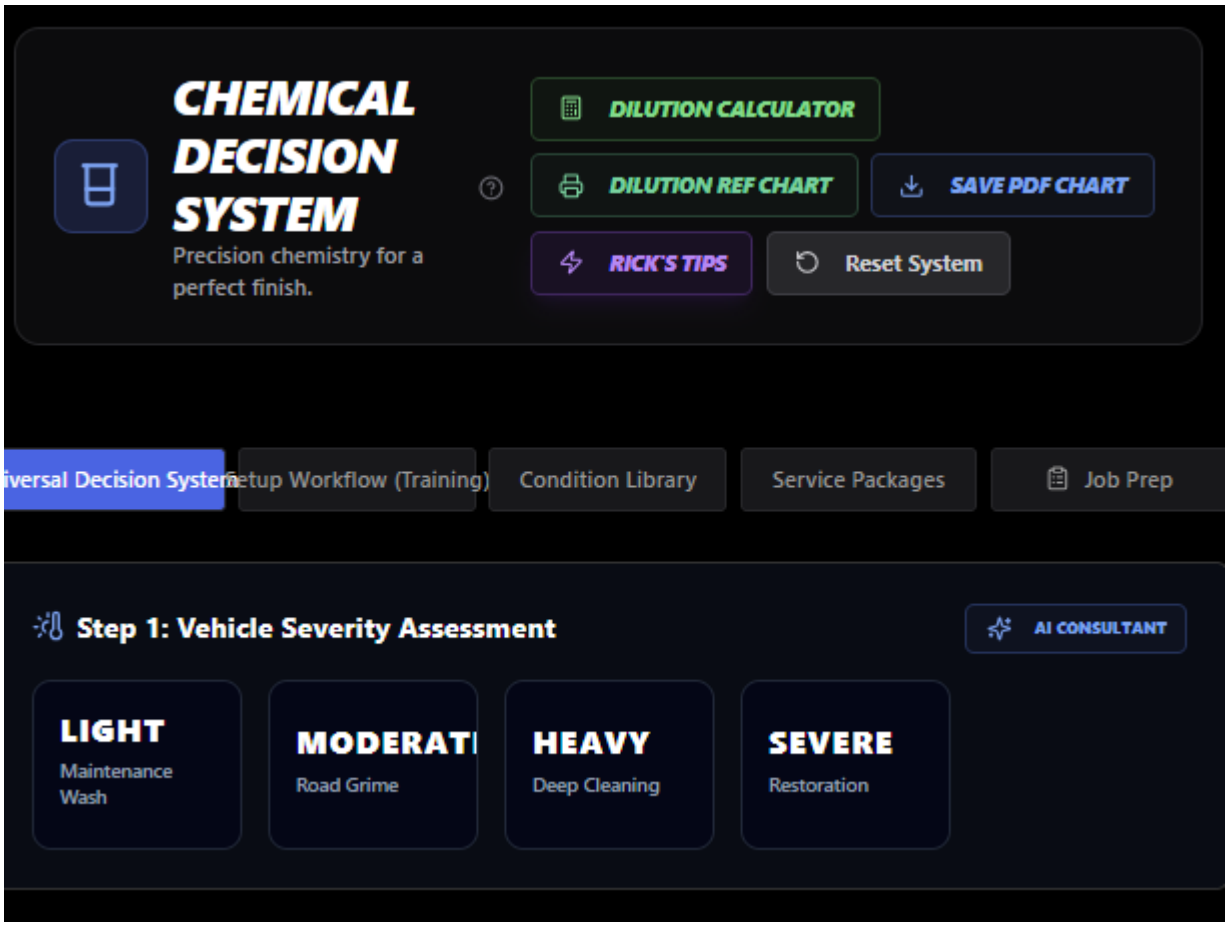

Dilution Ratio Chart

A reference chart laying out dilution ratios across the full chemical inventory, organized by product — the fast-lookup version of the dilution knowledge covered in depth in the companion Beginner's Guide book.

Chemical Workflow

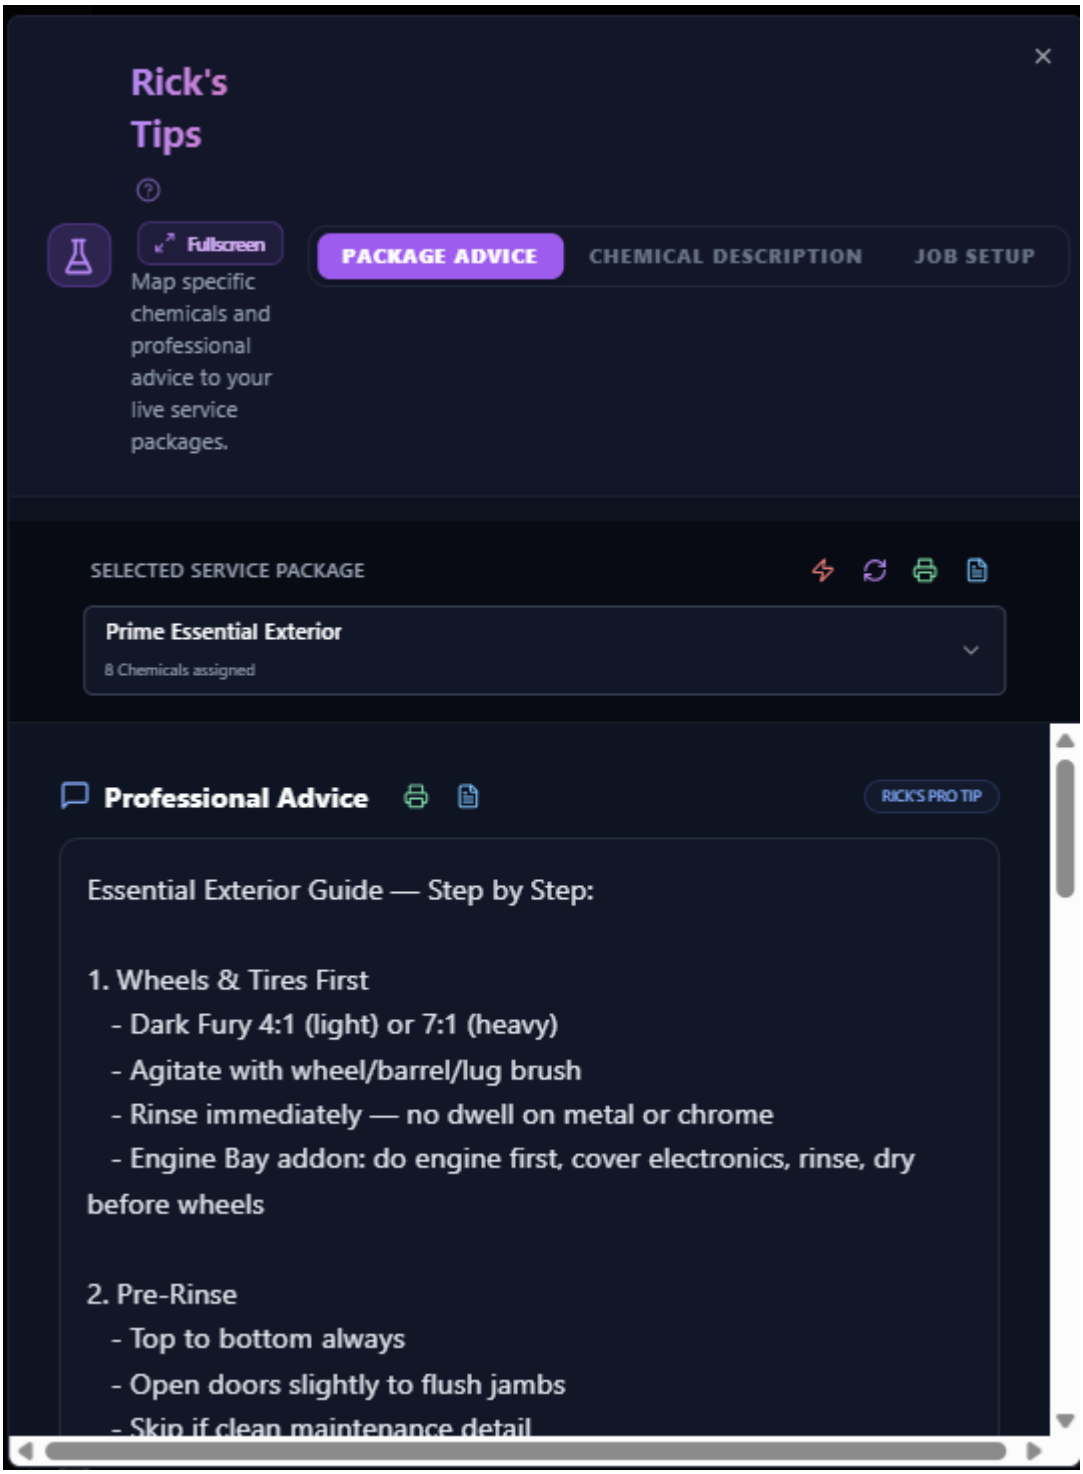

Training content walking through the correct decision process for chemical selection: identifying the substrate you're working with, classifying the type of contamination (organic, mineral, petroleum-based, or ferrous), and matching that to the right product and dilution strength — rather than reaching for a chemical based on habit alone.

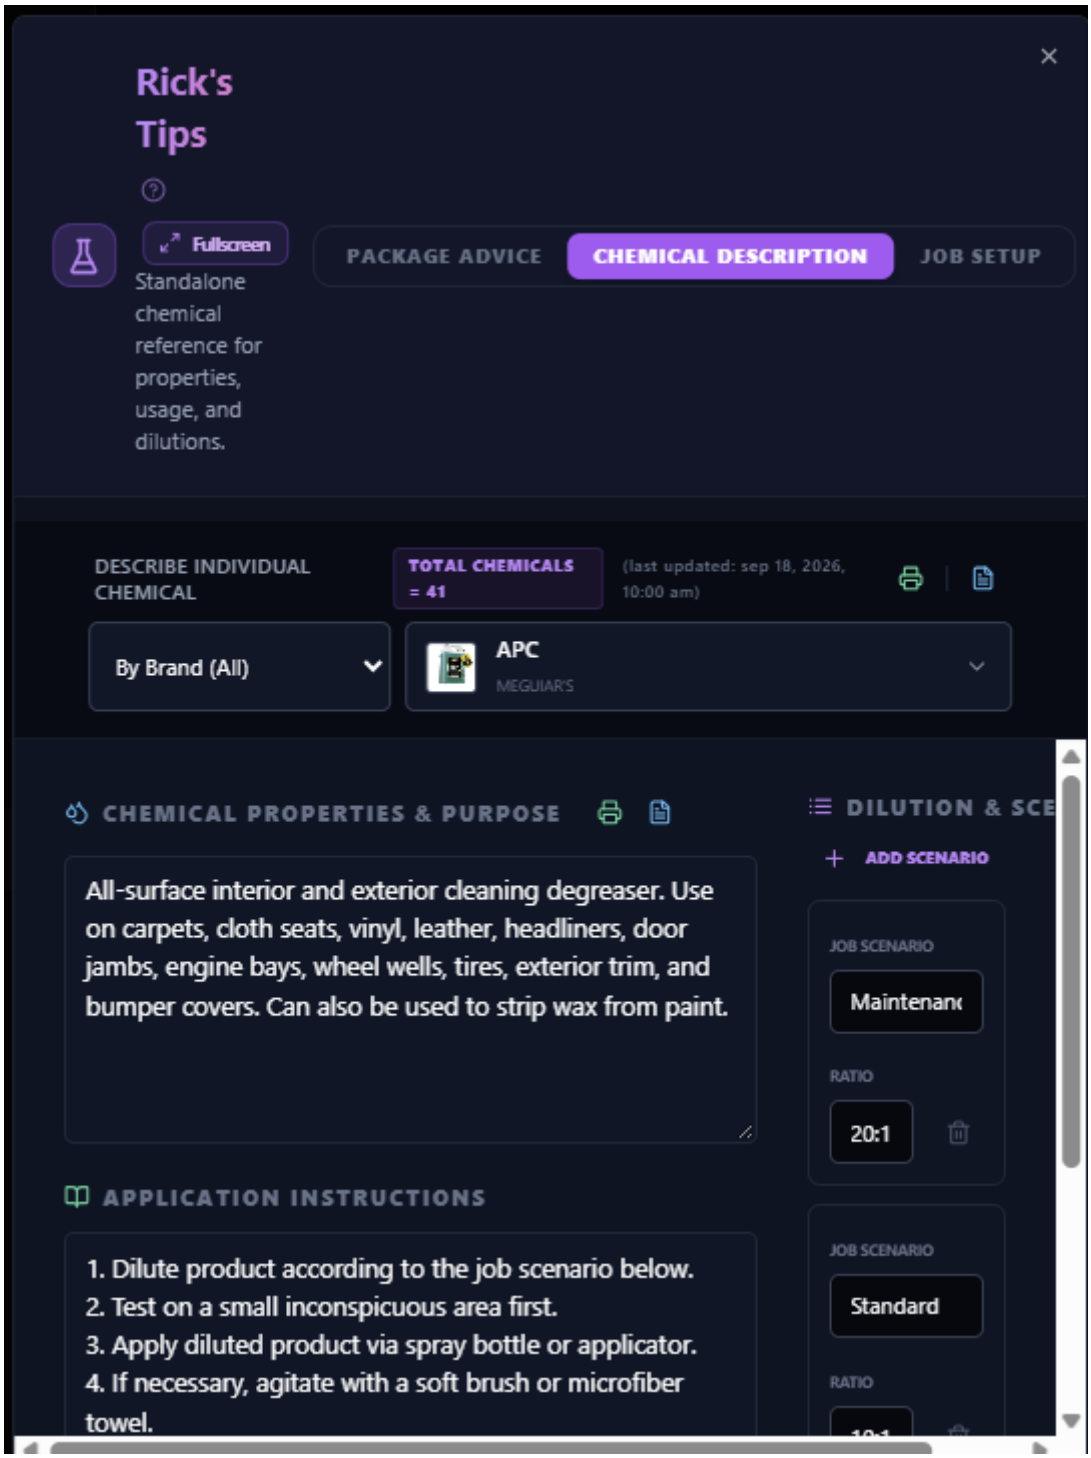

KEY FEATURES

- Substrate identification guidance
- Contamination classification (organic, mineral, petroleum, ferrous)
- Matches classification to the correct product and dilution

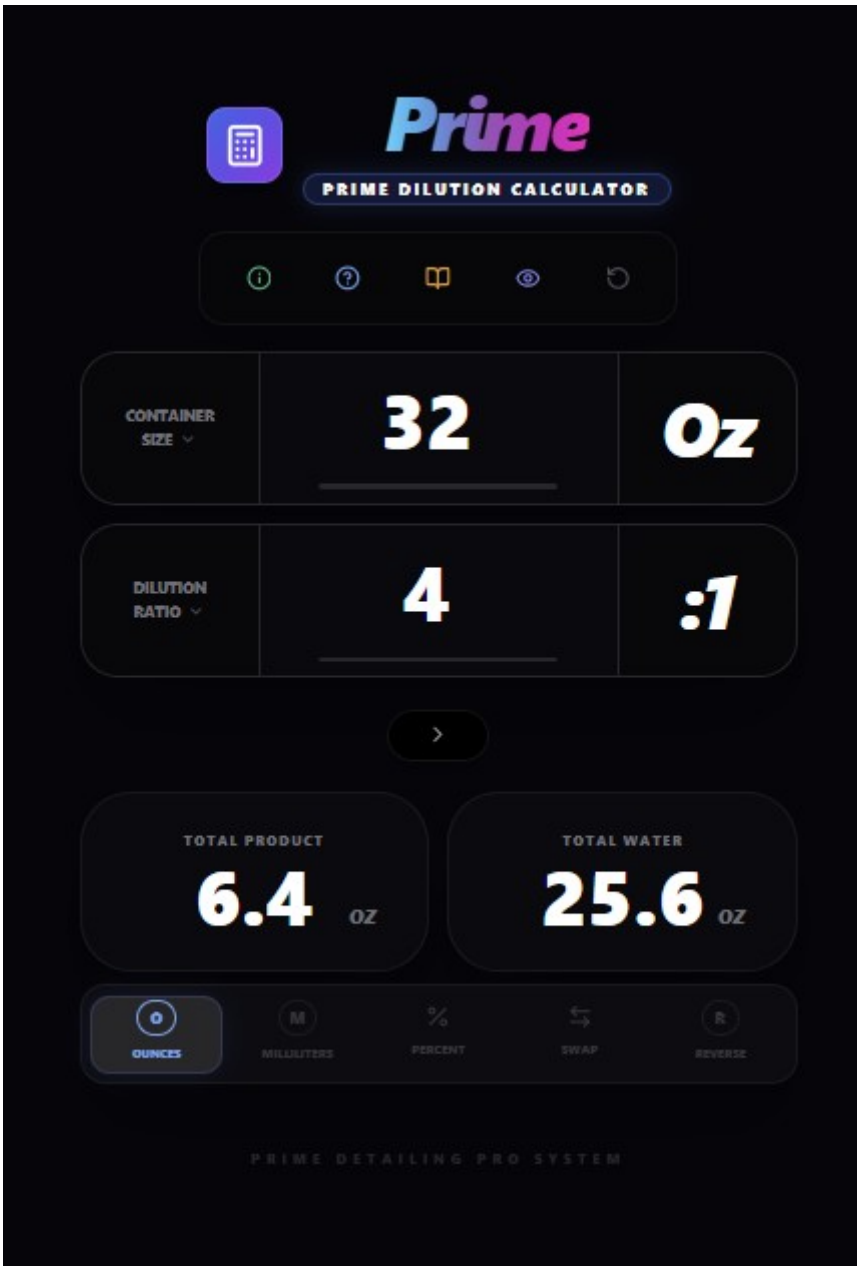

Rick's Tips

Admin-authored, real-world tips tied to specific chemicals and specific steps in the process — the kind of hard-won knowledge that doesn't fit neatly into a formal SOP but genuinely helps a technician avoid a common mistake or get a better result.

Rick's Tips

Prime Dilution Calculator

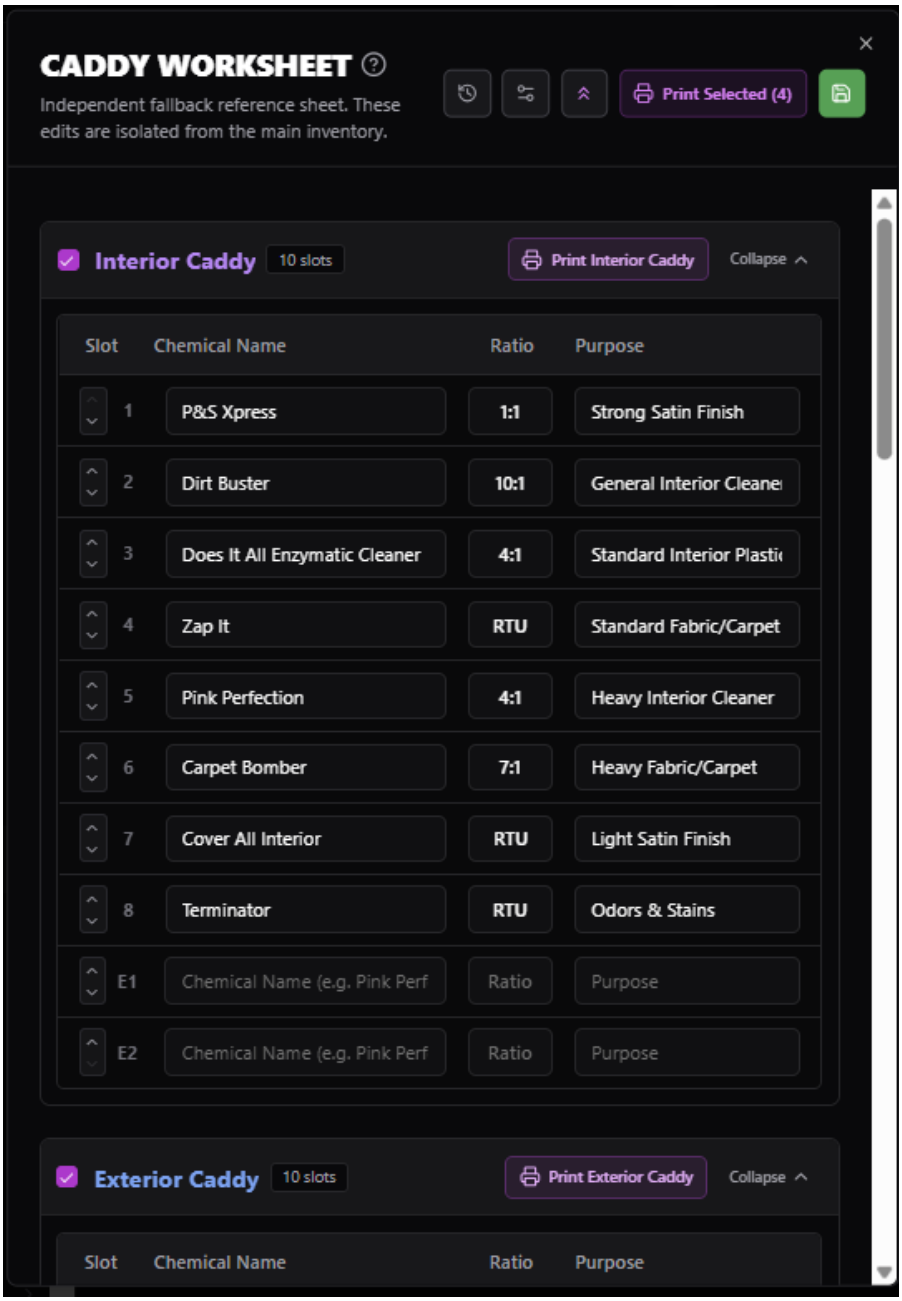

An interactive calculator built on the universal dilution formula (Total Volume ÷ (Ratio + 1)) — enter any container size and target ratio, and it tells you exactly how much concentrate and water to use, removing any manual math or guesswork from mixing chemicals correctly.

KEY FEATURES

- Works for any container size and any ratio
- Removes manual math from daily chemical mixing

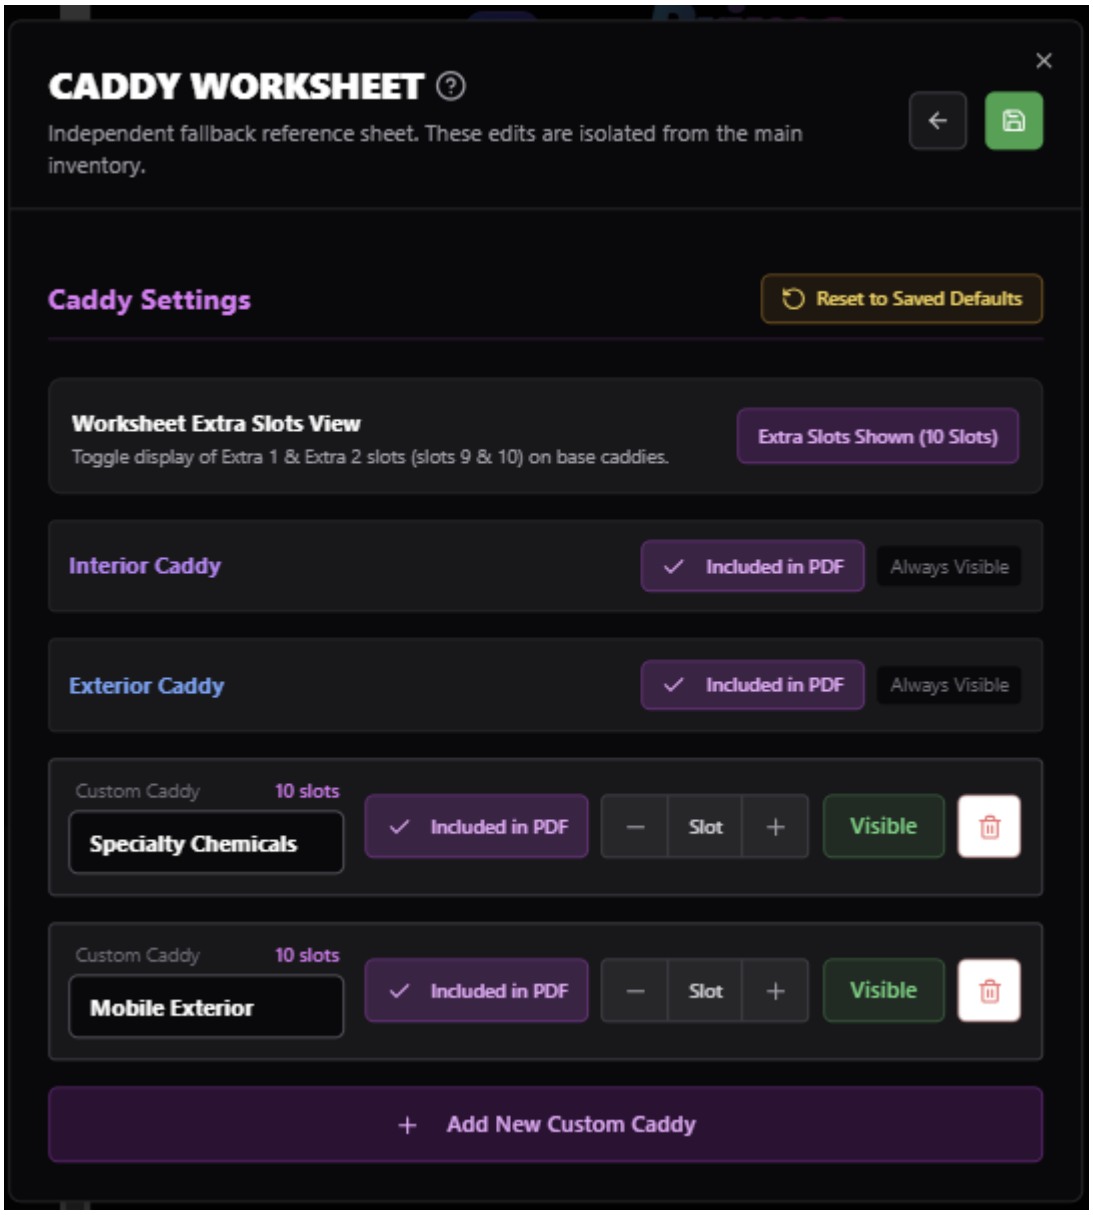

Caddy Worksheet

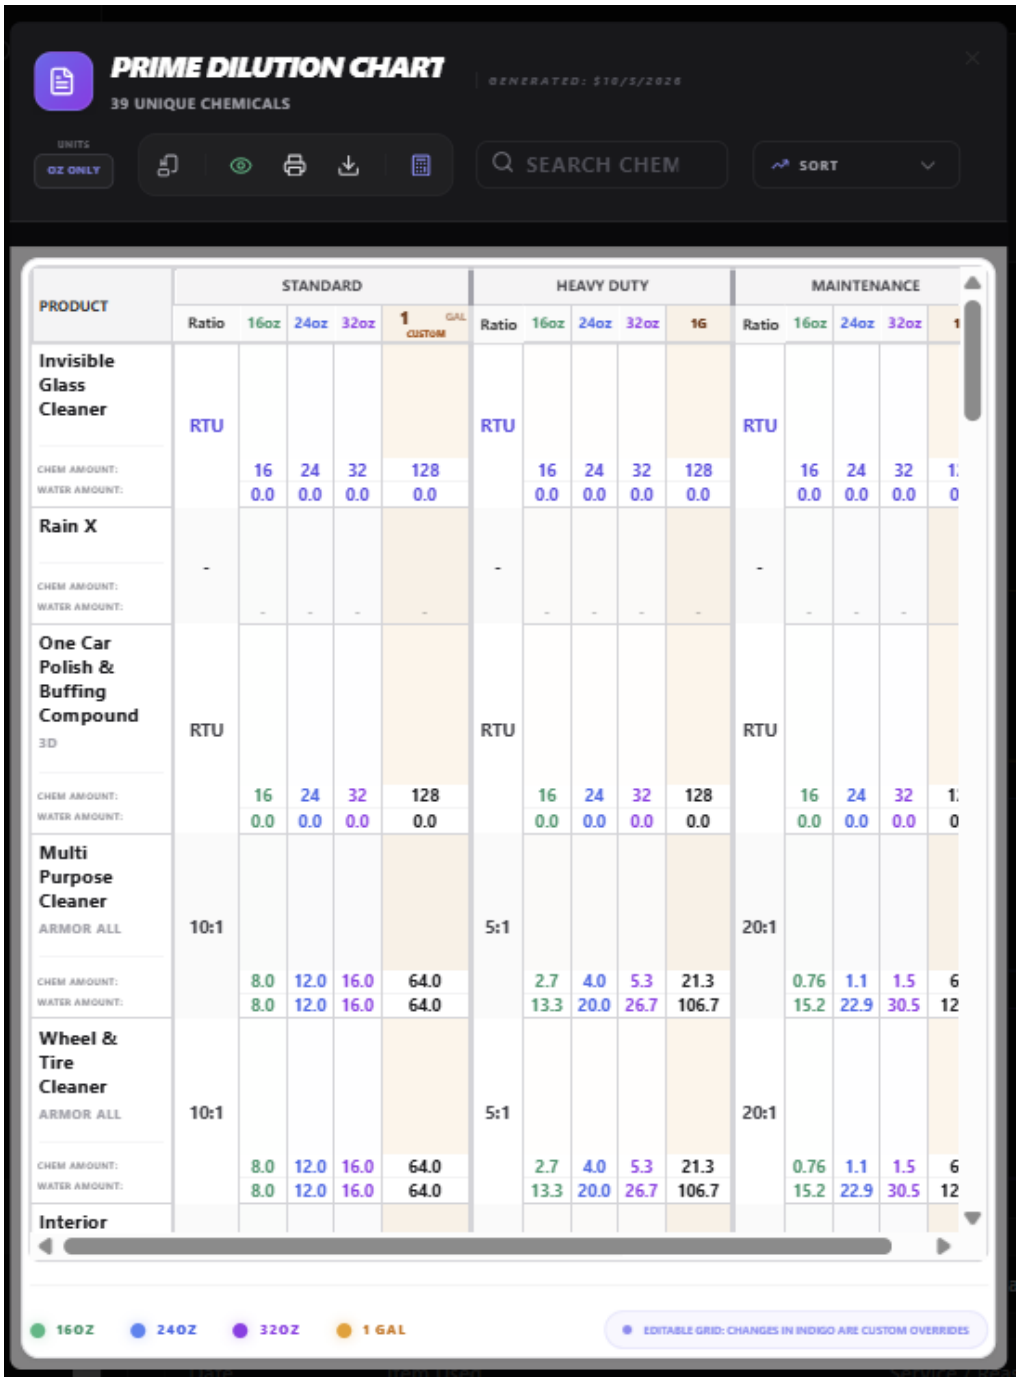

The static, cross-device-synced worksheet organizing chemicals into Interior, Exterior, and Specialty caddies, slot by slot, each with its dilution ratio and specific purpose — the exact real-world system this document's companion Beginner's Guide book draws its own operational chapter from.

KEY FEATURES

- Interior, Exterior, and Specialty caddy organization
- Slot-by-slot ratio and purpose reference
- Synced across devices, editable via Manage Caddies

CADDY WORKSHEET
Independent fallback reference sheet. These edits are isolated from the main inventory.

INVENTORY & ASSETS

8 feature pages in this category

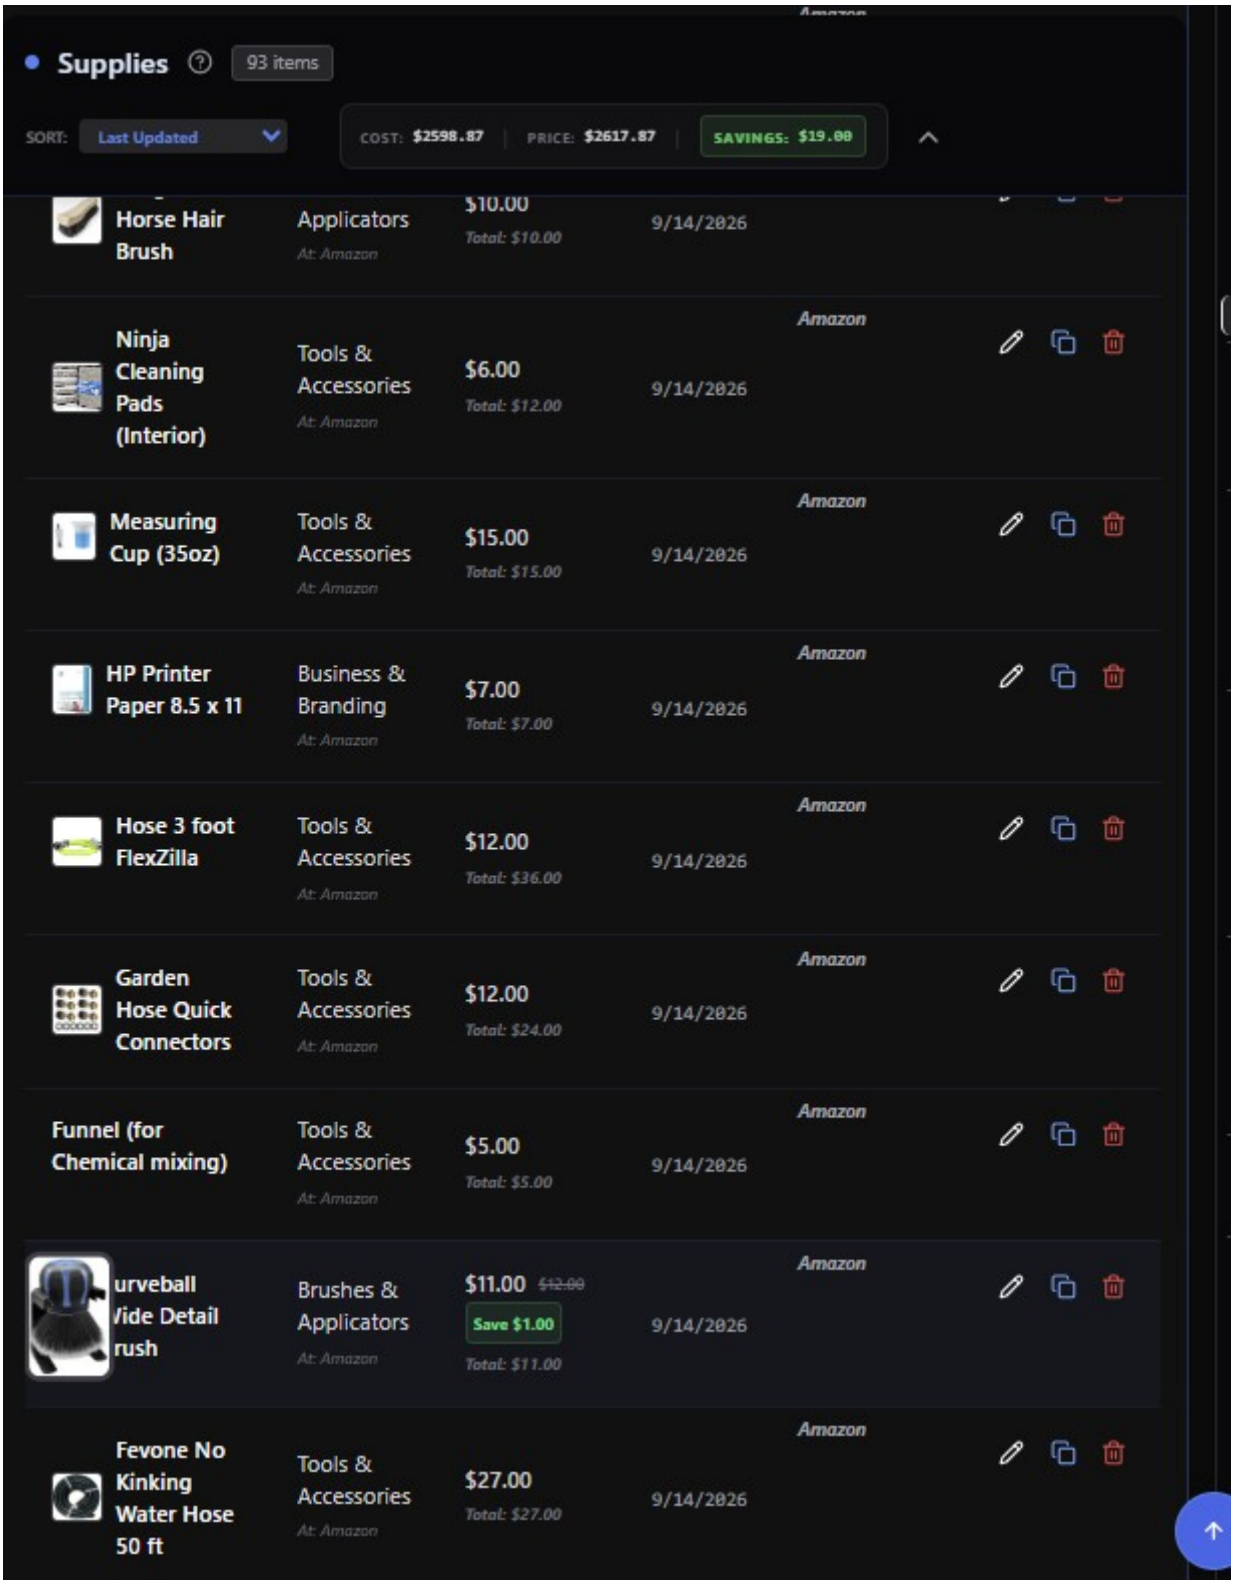

Inventory Control

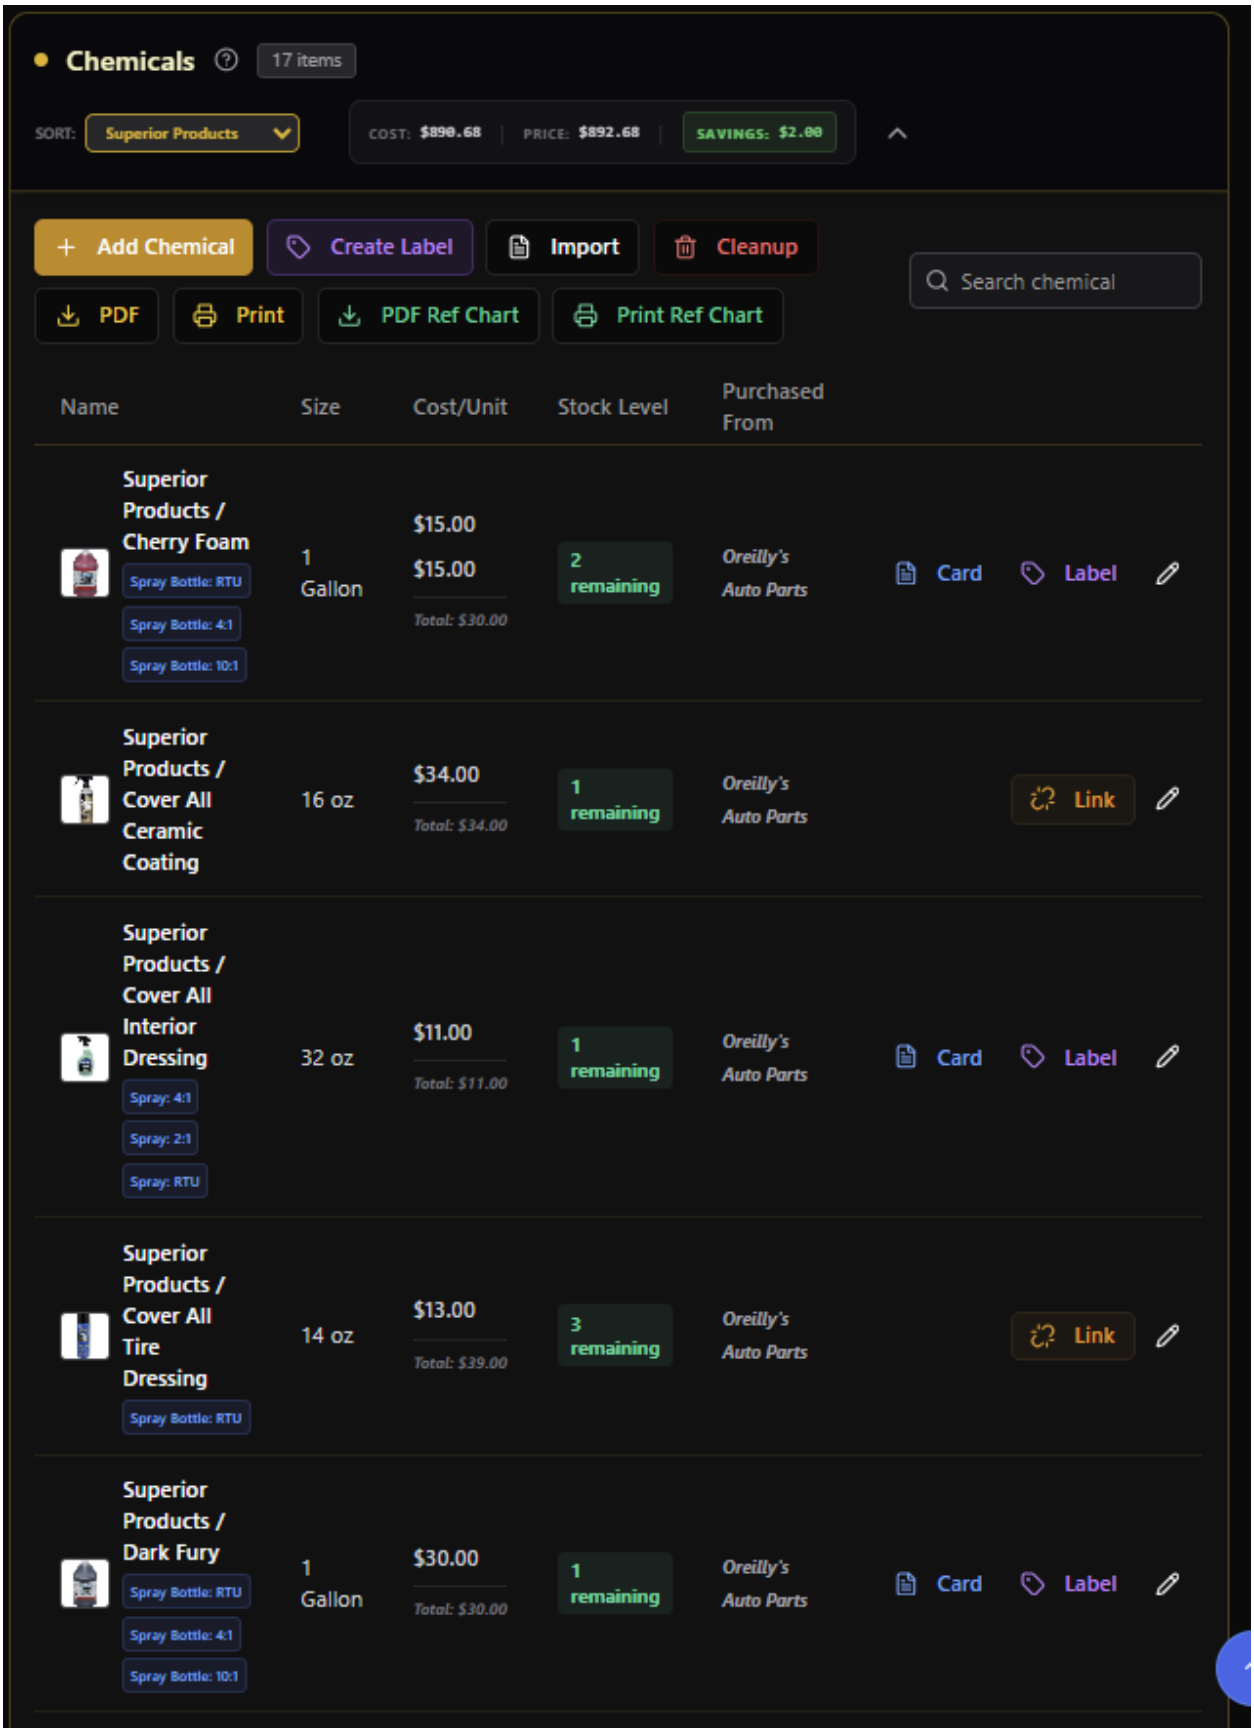

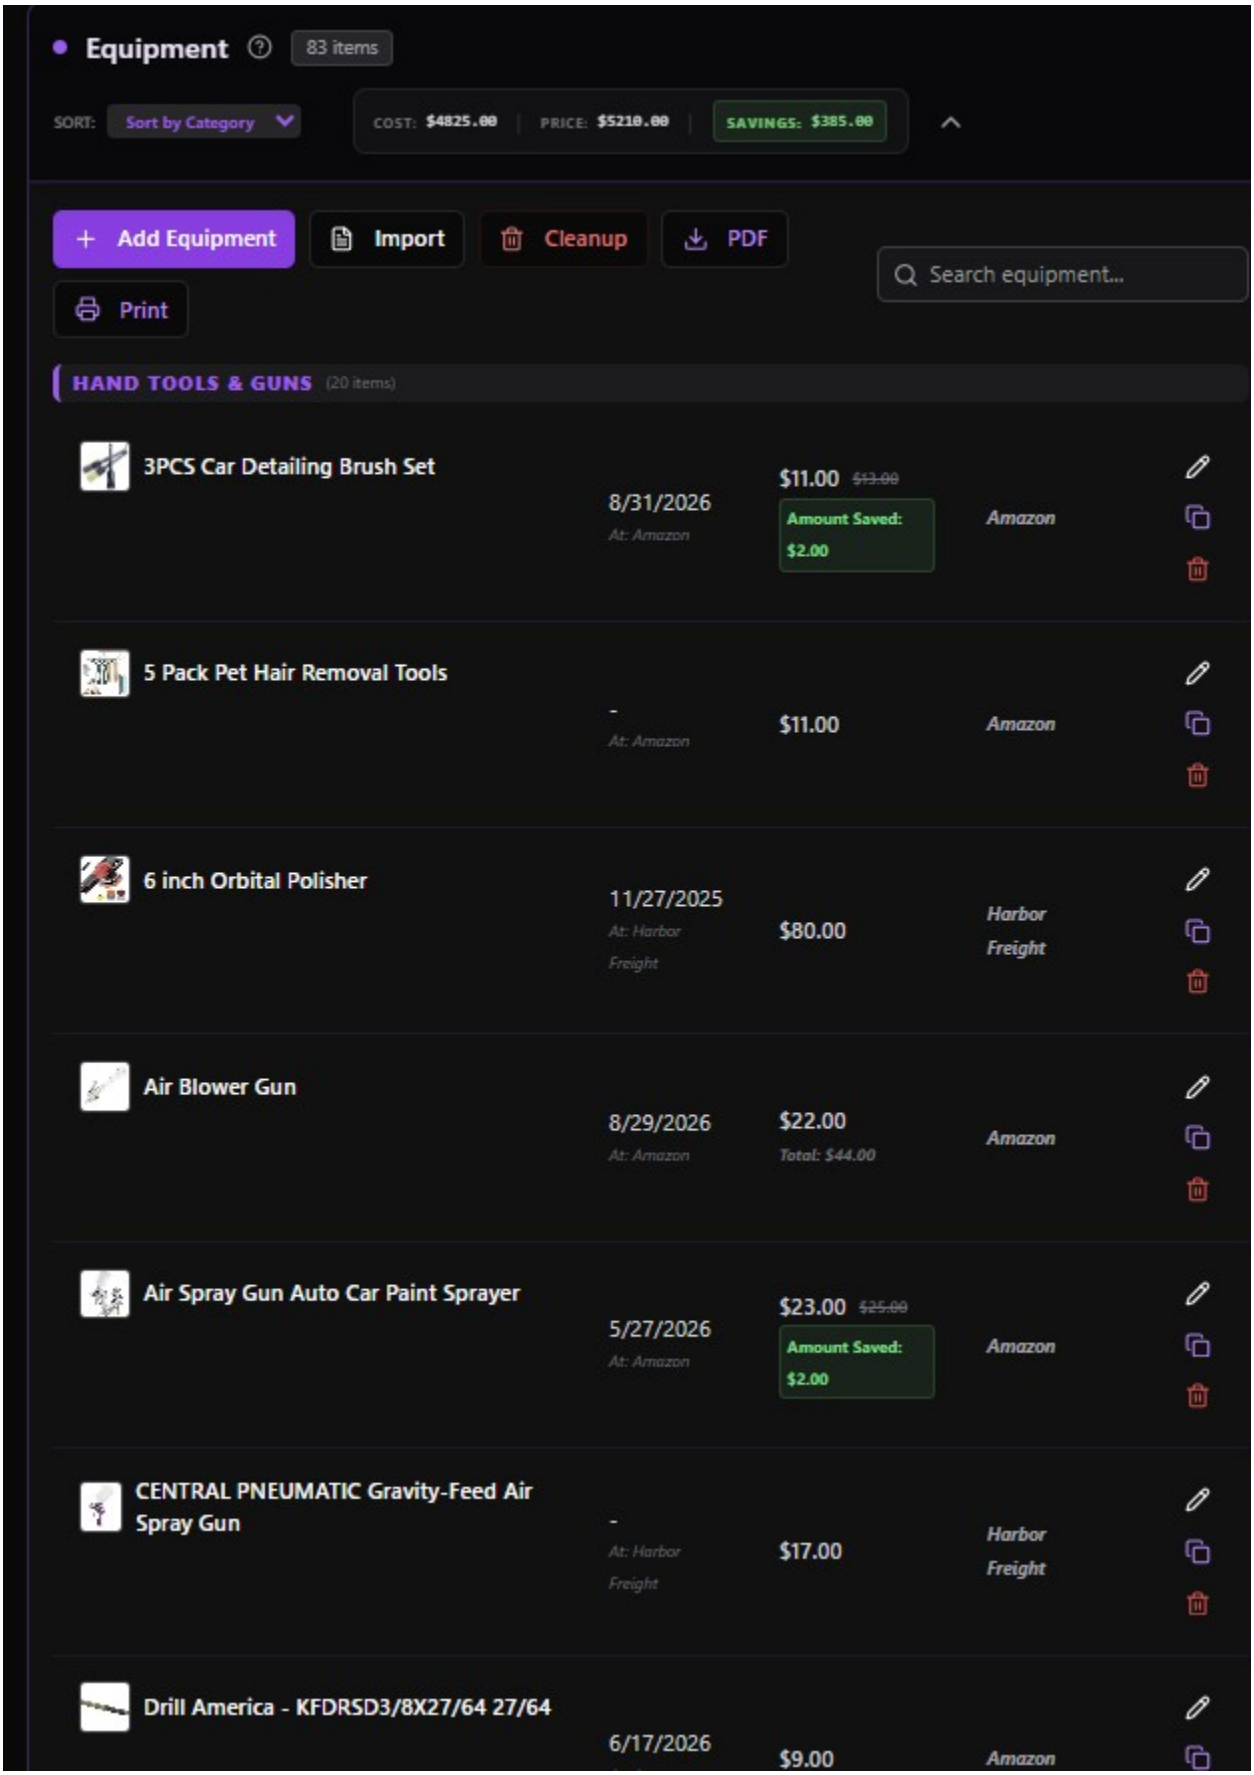

The master inventory system spanning Chemicals, Supplies, and Equipment, organized around the shop's real physical layout — a 3-rack location taxonomy (Medium Grey Rack, Small Brown Rack, and 1x4 Back Wall Shelf, each with defined shelves) plus a dedicated Chemical Rack, with a shared, consistent category system across all three inventory types.

KEY FEATURES

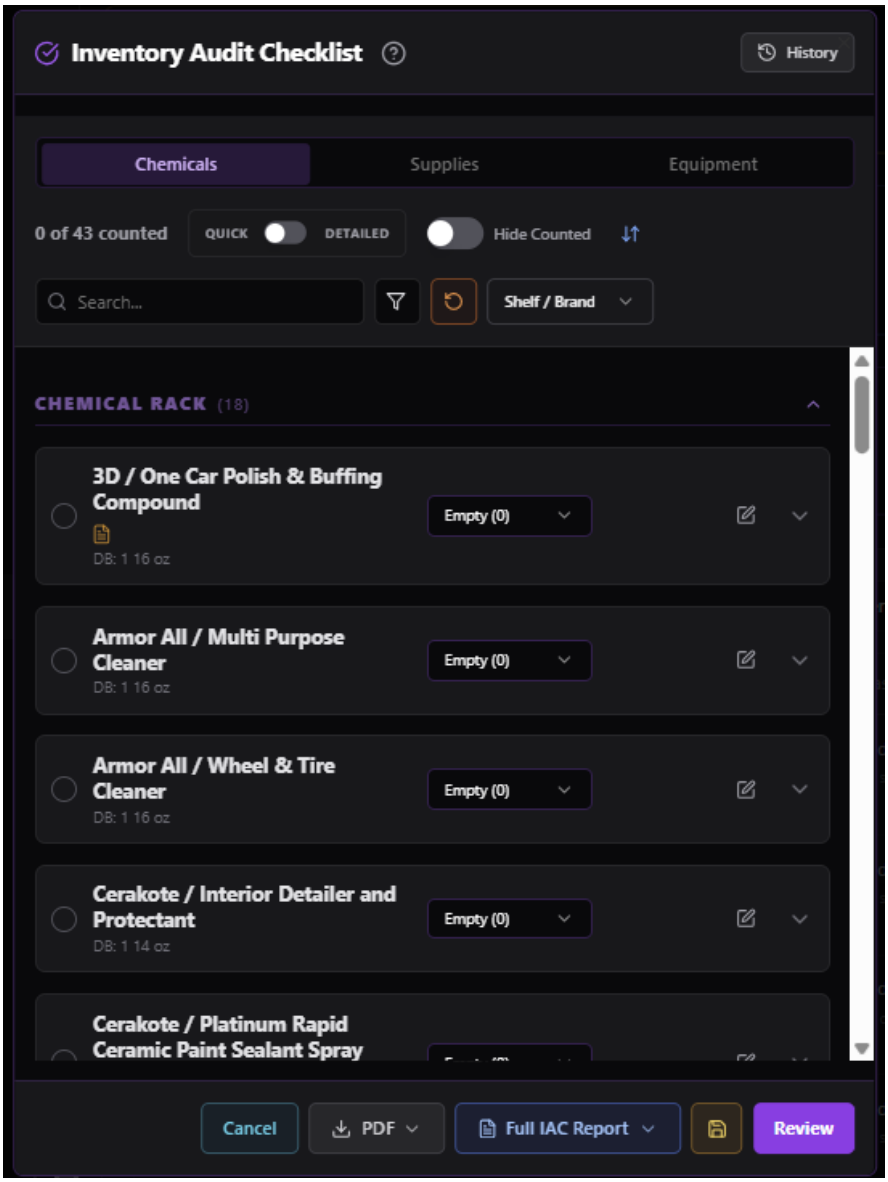

- Location taxonomy matching the shop's actual physical racks and shelves
- Shared categories across Chemicals, Supplies, and Equipment
- Supports bulk location reassignment and custom locations

Inventory Audit Checklist (IAC)

A structured, bi-weekly physical stock-count process with built-in variance reconciliation — comparing what the system thinks you have against what's actually on the shelf, flagging discrepancies past a set threshold so shrinkage or data-entry errors get caught early rather than discovered months later.

KEY FEATURES

- Bi-weekly physical count cadence
- Automatic variance flagging against a defined threshold
- Print/PDF export with category and location grouping

Inventory Audit Guide

Everything you need to know to effectively audit your inventory.

Counting Controls

- **Quick vs. Detailed Mode:** Quick mode lets you count whole units (like Gallons). Detailed mode opens a dropdown to count partial amounts (e.g., 0.5 bottles).
- **Quick Edit Inline:** Use the + / - buttons on Chemical cards to quickly add or remove whole units, or use the Partial Dropdown for exact fill levels.
- **Bottle Size Dropdown:** Replaces the old Unit of Measure. Select standard sizes or add custom ones directly in the item's edit modal.
- **Product Type Toggle:** Switch between "Used As-Is" (direct from bottle) and "Concentrate" (diluted with water) to properly track liquid usage.

Filtering & Visibility

- **Filter & Sort Panel:** Combine filters like Brand, Size, Shelf, Section, and Location to narrow down exactly what you are counting.
- **"X of Y counted" Badge:** Tracks your live progress. It updates dynamically to reflect only the items visible in your current filter.
- **Global Sort Dropdown:** Quickly sort the entire list by Name, Brand, Location, Last Updated, etc.
- **Hide Counted:** Toggle to make completed items disappear to keep your list clean.
- **Section Collapse/Expand:** Use the dropdown icon on any location header (e.g. "Top Shelf / Left Side") to collapse/expand that specific section.
- **Caddy Locations:** Items assigned to the Interior, Exterior, or Specialty Caddies (slots 1-8) are intelligently grouped together under a single "Caddy" header so you can view all 8 slots simultaneously.

Organization & Assignment

- **Chemicals (Shelf, Section, Category):** Assigned via the edit modal. You can filter the audit list by these values to count one section at a time.
- **Supplies & Equipment (Location, Container Location):** Uses a preset system to standardize where items live. Racks include Medium Grey Rack, Small Brown Rack, and 1 x 4 Back Wall Shelf with shelf levels from Bottom Shelf to Top Shelf. You can filter the audit list by these locations.
- **Supplies Details:** Supplies feature expand-cards showing Condition/Wear Status, Last Used Date, and Compatible/Companion Items (which link bidirectionally to other items).
- **hideFromIac:** In any item's edit modal, check "Do NOT Show in IAC" to permanently exclude it from all audits and PDF reports.

Saving, History, & Exports

- **Save Progress:** Pause your audit at any time without submitting. Resume later from the History tab.
- **Audit History:** View past snapshots of your inventory, archive old audits, or permanently delete them (with confirmation).
- **PDF:** Generates a printable PDF of your current live audit view and counts for a single tab. Includes a dedicated **Size** column for chemicals.
- **Full IAC Report:** Generates one combined PDF across all 3 categories (Chemicals, Supplies, Equipment) as separate sections, available from any tab.
- **Review:** When finishing an audit, use this button to review and commit your changes. (You can also save/print a verified record here).

Inventory Audit Checklist

Materials Usage Log

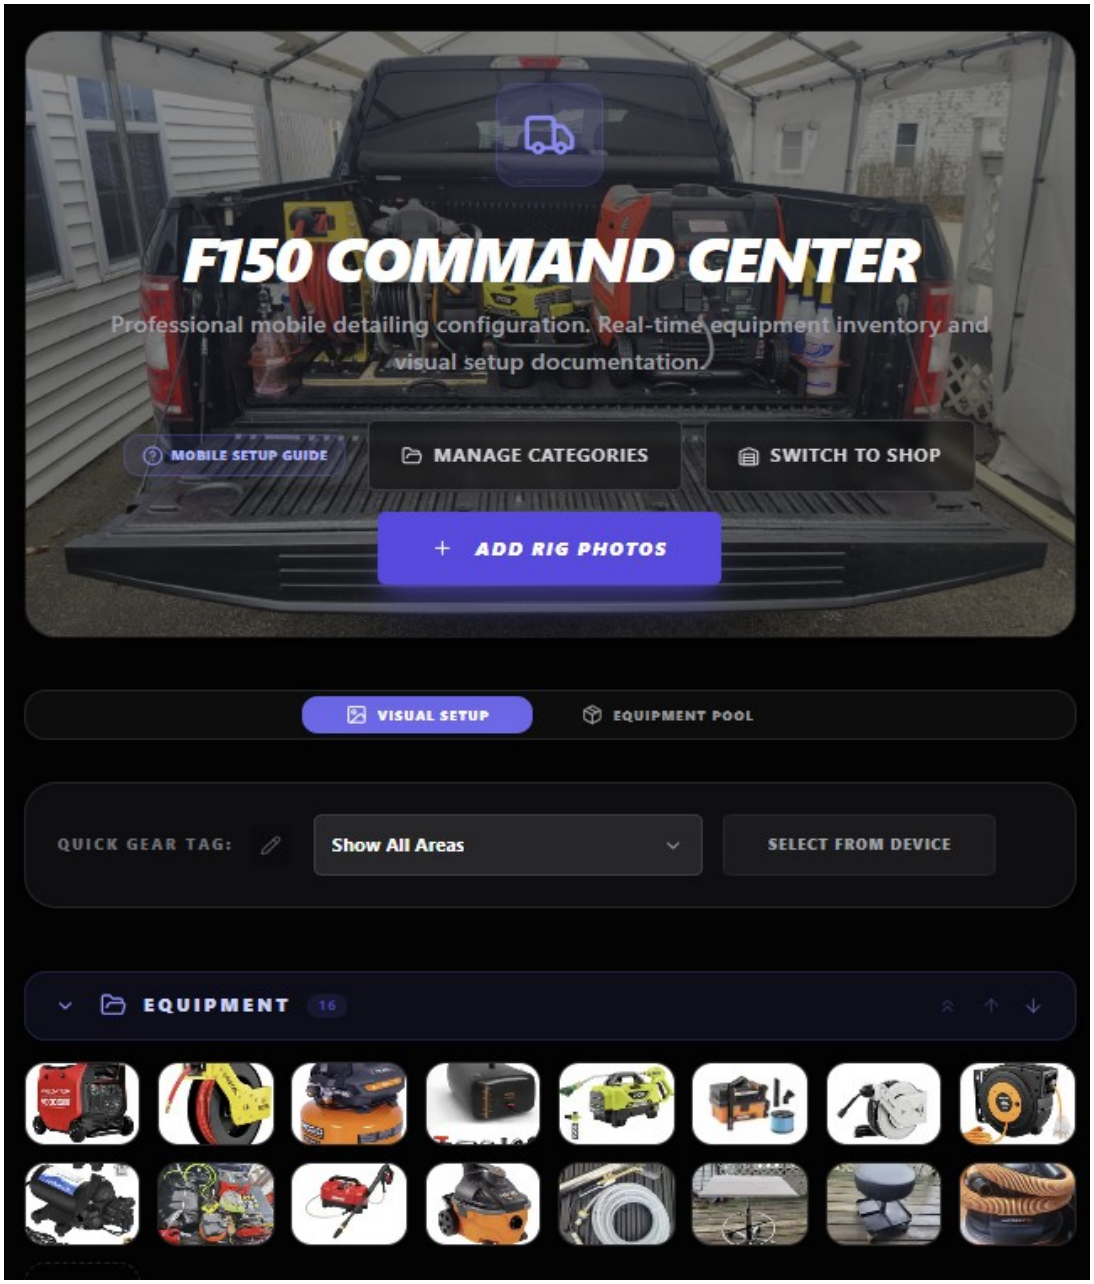

A reporting-only log tracking what chemicals and materials were actually used per job — supporting real cost-per-job tracking without automatically deducting stock levels, since automatic deduction introduces its own accuracy problems the business deliberately avoided.

Mobile Setup

Configuration and checklist tools purpose-built for the mobile detailing rig — covering water payload planning, power system routing (inverter and generator setup), and loadout management, so nothing gets left behind before heading out to a job away from the shop.

KEY FEATURES

- Water payload and power system configuration
- Loadout checklists tailored to the mobile rig

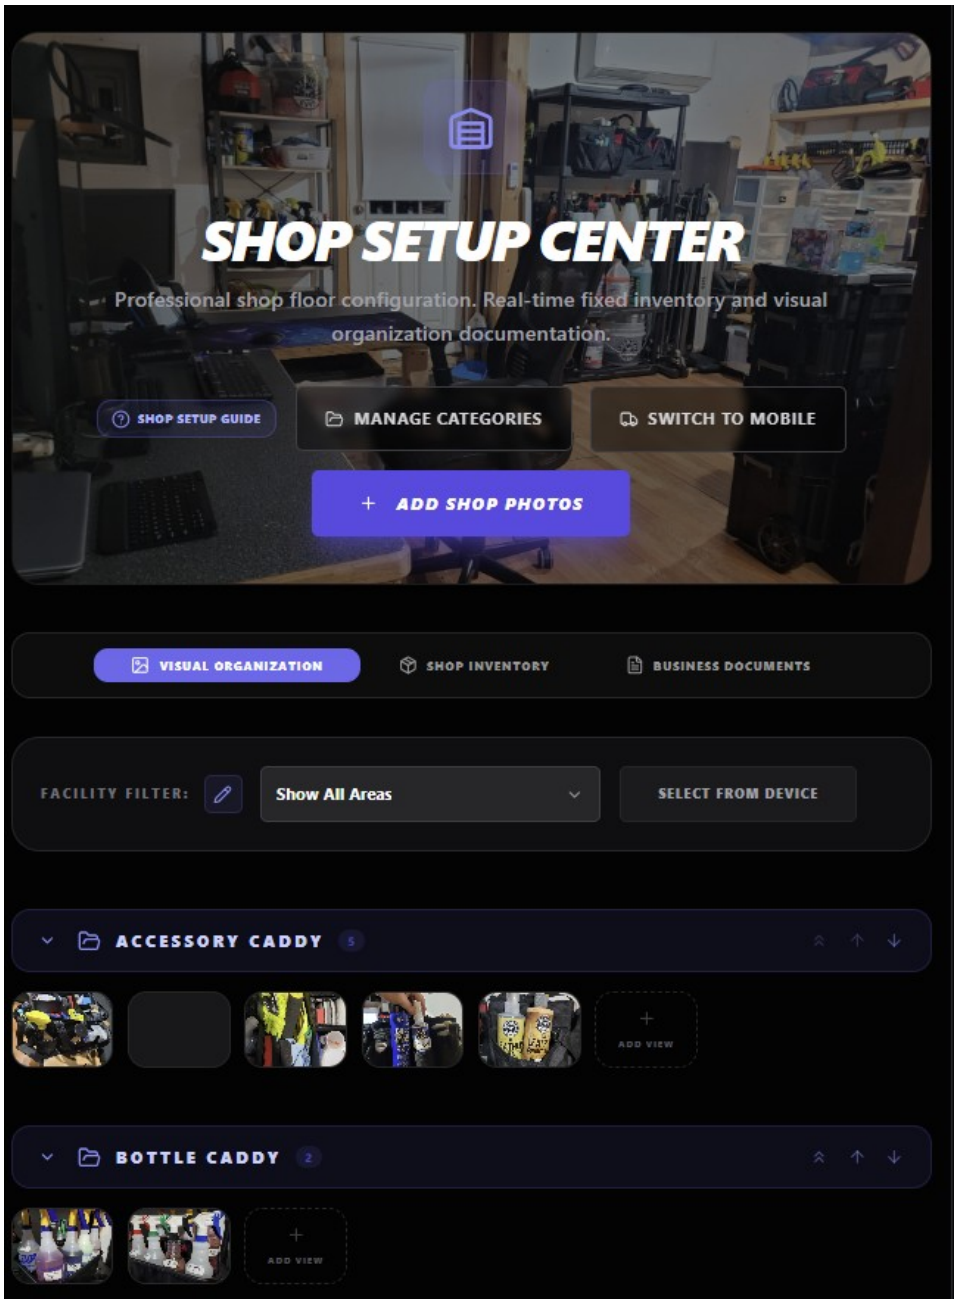

Shop Setup

Configuration tools for the fixed shop location itself — visual organization of the physical space and a preview-first, searchable grid of business documents with real thumbnail previews, two-way synced with the File Manager.

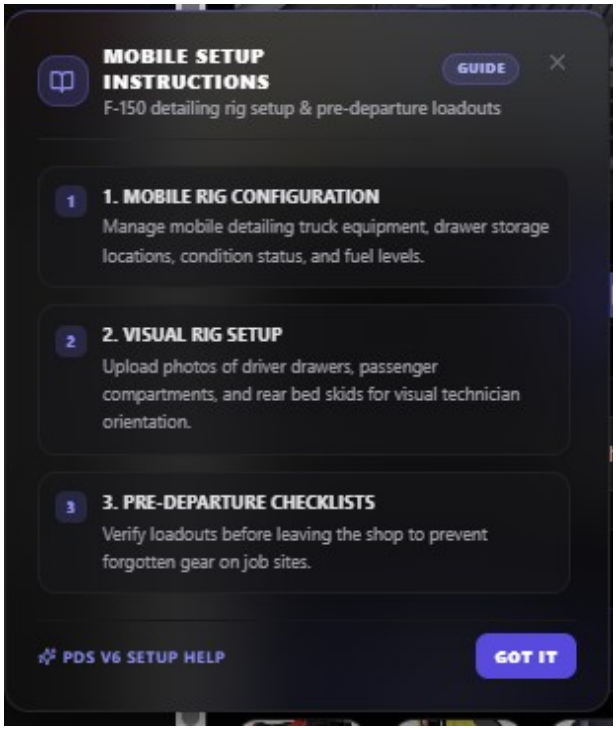

KEY FEATURES

- Visual shop organization tools
- Searchable business document grid with thumbnail previews

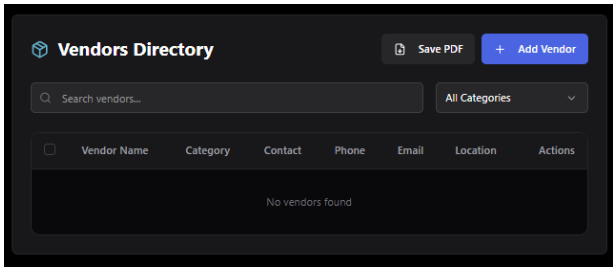

Shop Setup Instructions
GUIDE
Facility layout, master inventory & document repository
1
1. Shop Layout DocumentationUpload photos & walk-around videos of detailing bays, ceramic coating rooms, and chemical stations.
2
2. Master Inventory IntegrationConnect chemicals, polishers, microfiber towels, and detailing gear directly to central database inventory.
3
3. Area CategoriesOrganize shop zones using custom categories (e.g. Wash Bay, Ceramic Room, Office) to keep technicians oriented.
4
4. Business Documents RepositorySwitch to the Business Documents tab for visual PDF previews of SOPs, SDS sheets, and pricing guides.

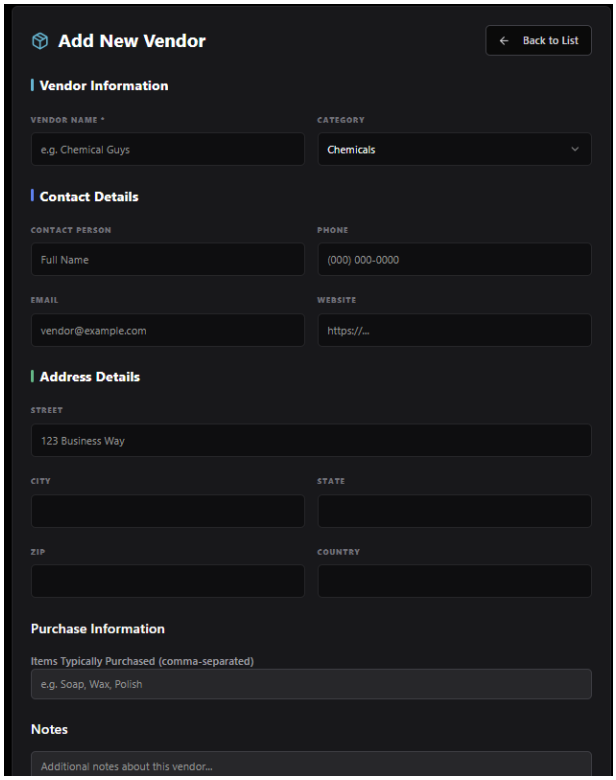

Detailing Vendors

A vendor and supplier management view tracking where every product and piece of equipment is sourced from — useful for reordering quickly and for evaluating whether a given supplier is still the best option.

PRIME LEARNING CENTER

Standard Operating Procedures (SOPs)

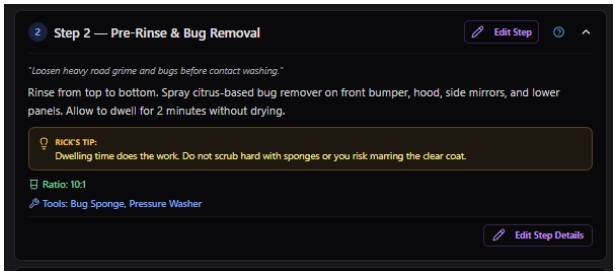

The single source of truth for every documented procedure in the business — edits made here automatically propagate to the Service Checklist's interactive steps, Employee SOP reference tooltips, Rick's Tips guidance, and app-wide inline help icons, so the procedure never has to be updated in more than one place.

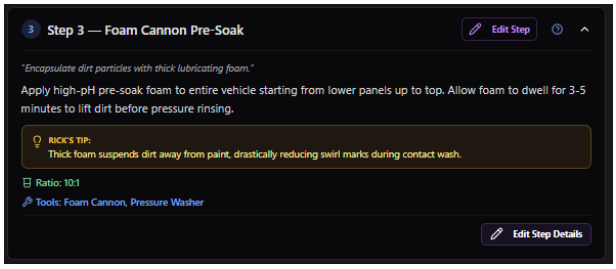

KEY FEATURES

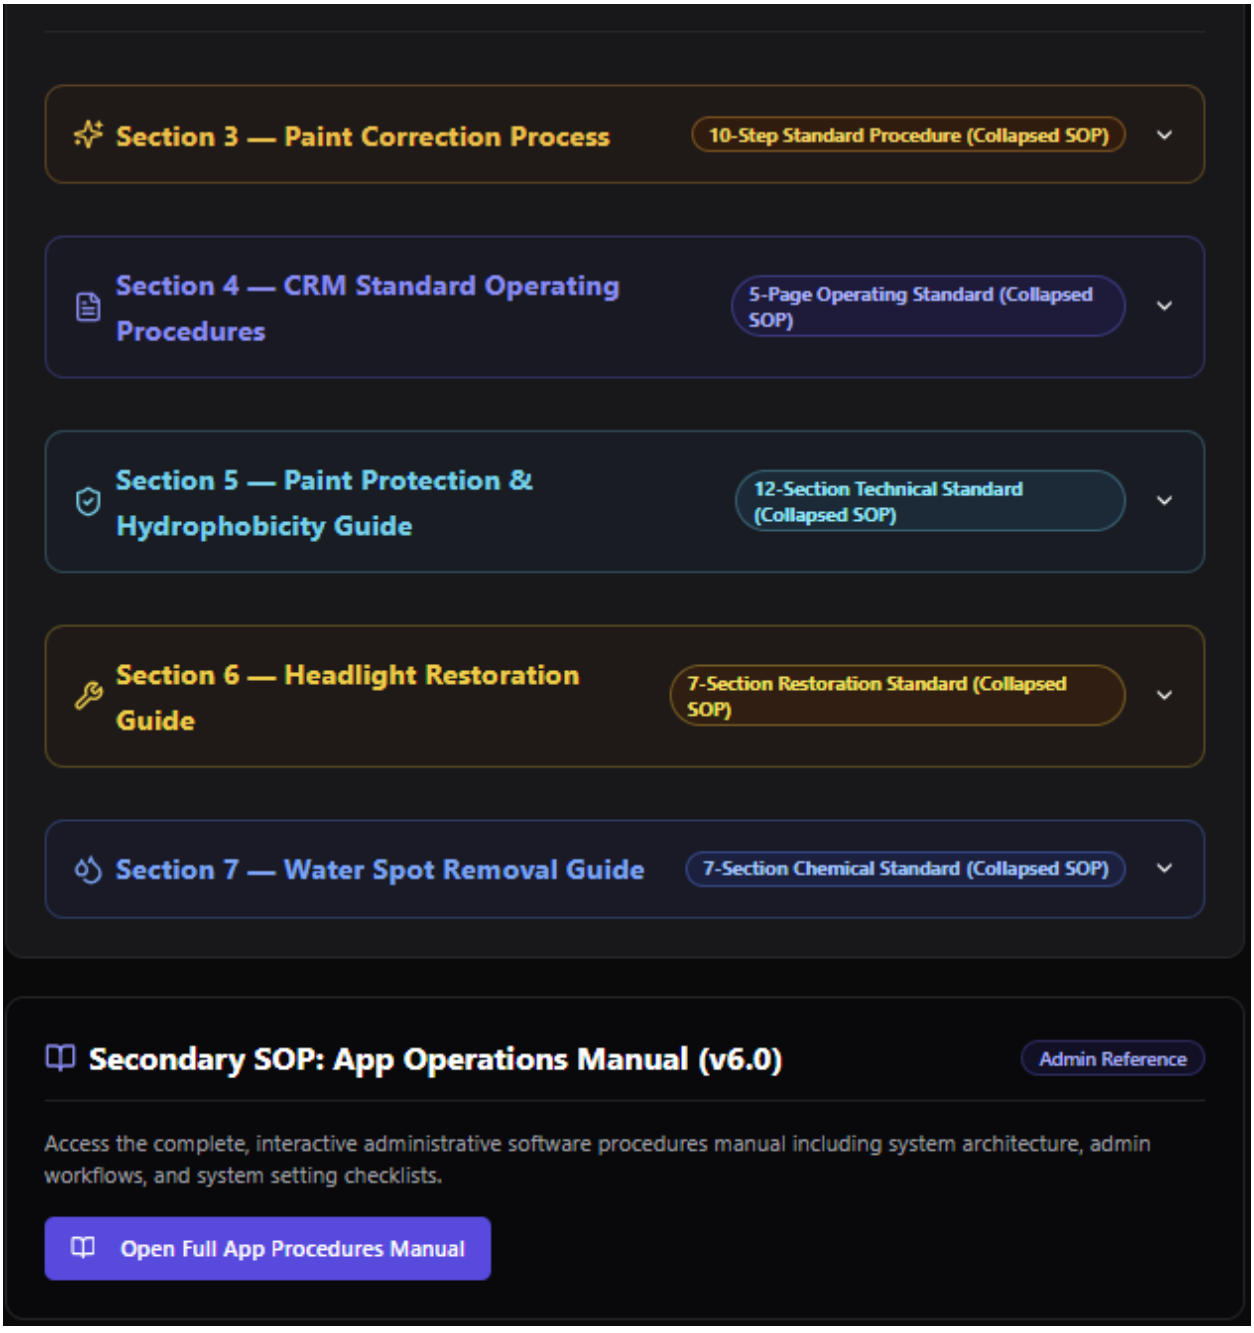

- Single-source editing that propagates to Checklist, tooltips, and help icons
- Eliminates the risk of procedures drifting out of sync across the app

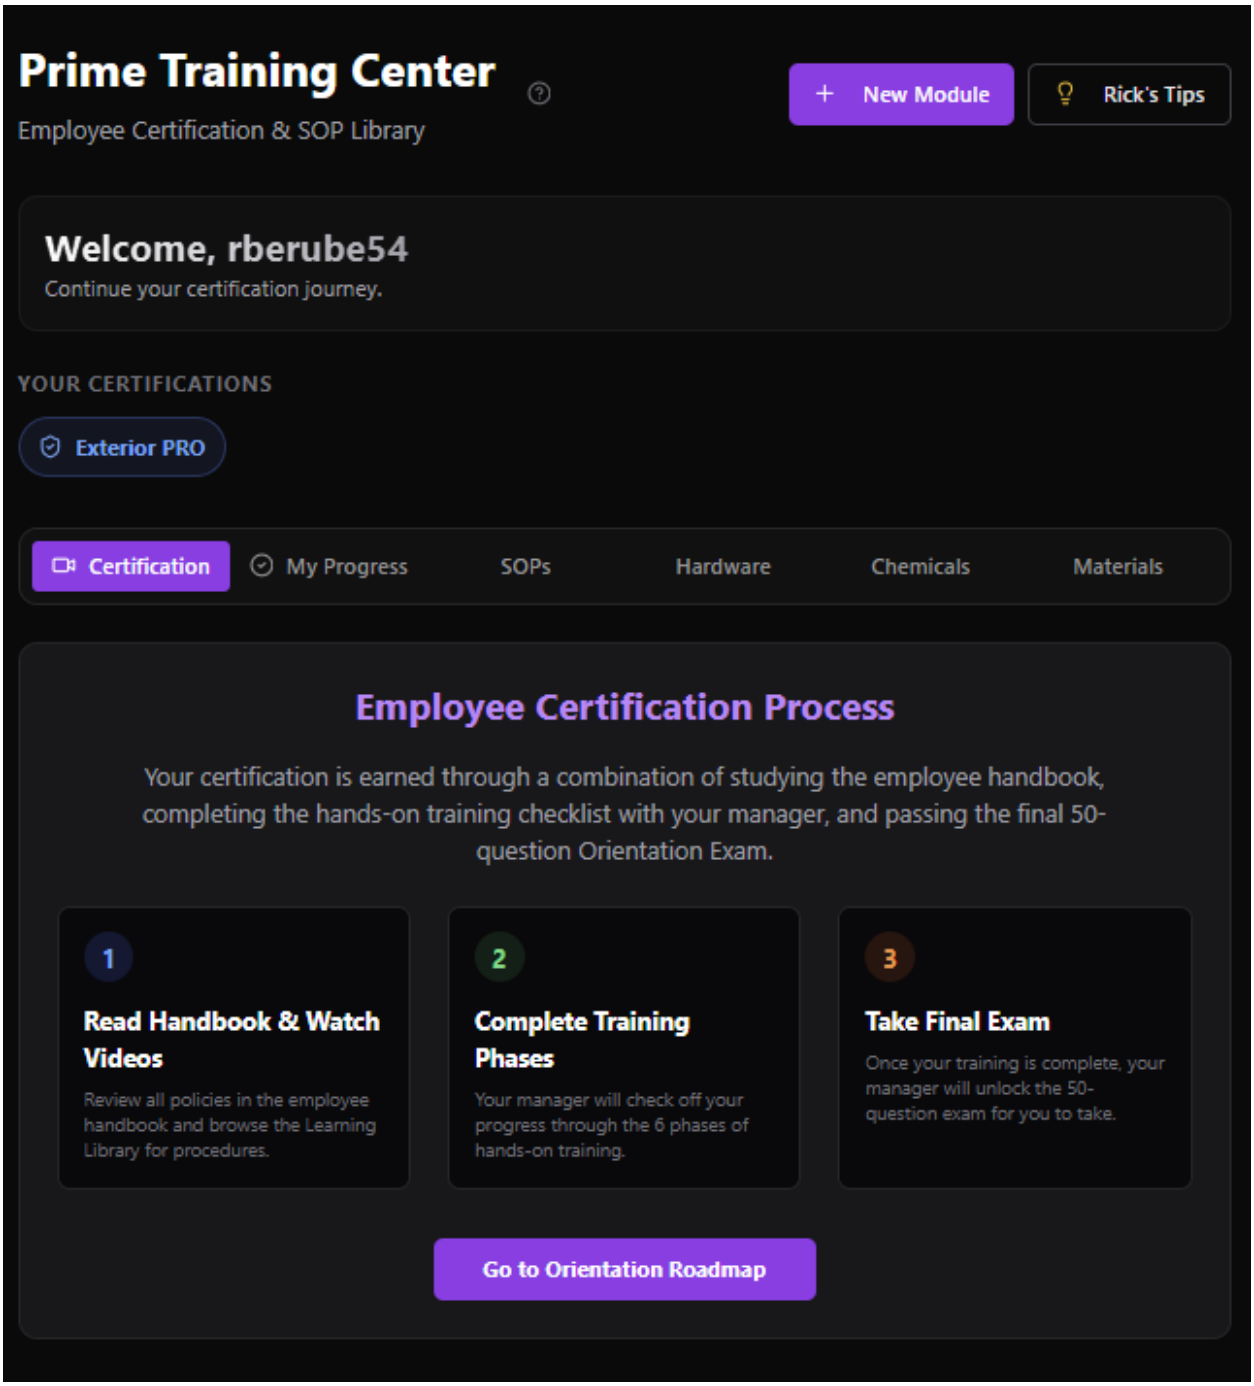

2 Step 2 — Pre-Rinse & Bug Removal
Edit Step
"Loosen heavy road grime and bugs before contact washing."
Rinse from top to bottom. Spray citrus-based bug remover on front bumper, hood, side mirrors, and lower panels. Allow to dwell for 2 minutes without drying.
RICK'S TIP:
Dwelling time does the work. Do not scrub hard with sponges or you risk marring the clear coat.
Ratio: 10:1
Tools: Bug Sponge, Pressure Washer
Edit Step Details

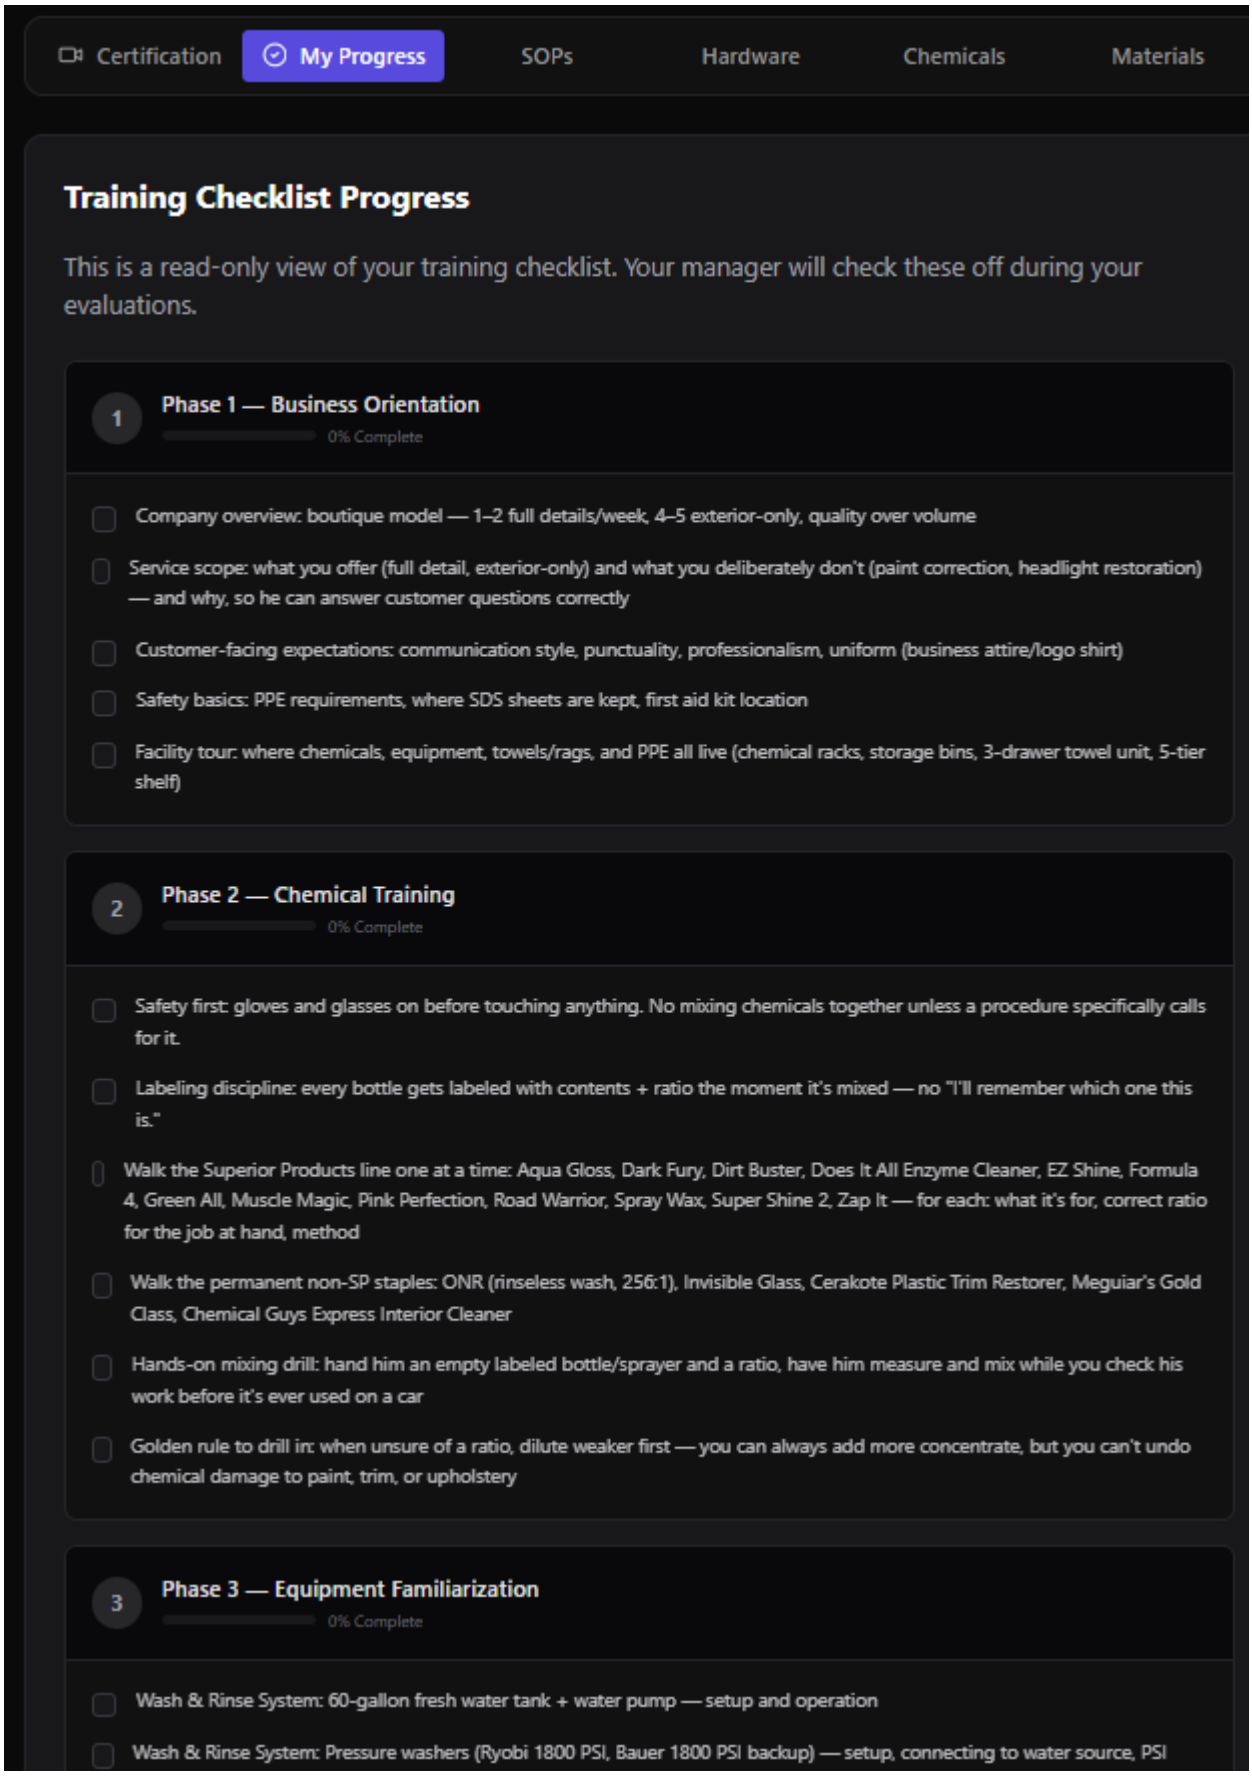

3 Step 3 — Foam Cannon Pre-Soak
Edit Step
"Encapsulate dirt particles with thick lubricating foam."
Apply high-pH pre-soak foam to entire vehicle starting from lower panels up to top. Allow foam to dwell for 3-5 minutes to lift dirt before pressure rinsing.
RICK'S TIP:
Thick foam suspends dirt away from paint, drastically reducing swirl marks during contact wash.
Ratio: 10:1
Tools: Foam Cannon, Pressure Washer
Edit Step Details

Training Checklist Progress
This is a read-only view of your training checklist. Your manager will check these off during your evaluations.
1
Phase 1 — Business Orientation
0% Complete
Company overview: boutique model — 1–2 full details/week, 4–5 exterior-only, quality over volume
Service scope: what you offer (full detail, exterior-only) and what you deliberately don't (paint correction, headlight restoration) — and why, so he can answer customer questions correctly
Customer-facing expectations: communication style, punctuality, professionalism, uniform (business attire/logo shirt)
Safety basics: PPE requirements, where SDS sheets are kept, first aid kit location
Facility tour: where chemicals, equipment, towels/rags, and PPE all live (chemical racks, storage bins, 3-drawer towel unit, 5-tier shelf)
2
Phase 2 — Chemical Training
0% Complete
Safety first: gloves and glasses on before touching anything. No mixing chemicals together unless a procedure specifically calls for it.
Labeling discipline: every bottle gets labeled with contents + ratio the moment it's mixed — no "I'll remember which one this is."
Walk the Superior Products line one at a time: Aqua Gloss, Dark Fury, Dirt Buster, Does It All Enzyme Cleaner, EZ Shine, Formula 4, Green All, Muscle Magic, Pink Perfection, Road Warrior, Spray Wax, Super Shine 2, Zap It — for each: what it's for, correct ratio for the job at hand, method
Walk the permanent non-SP staples: ONR (rinseless wash, 256:1), Invisible Glass, Cerakote Plastic Trim Restorer, Meguiar's Gold Class, Chemical Guys Express Interior Cleaner
Hands-on mixing drill: hand him an empty labeled bottle/sprayer and a ratio, have him measure and mix while you check his work before it's ever used on a car
Golden rule to drill in: when unsure of a ratio, dilute weaker first — you can always add more concentrate, but you can't undo chemical damage to paint, trim, or upholstery
3
Phase 3 — Equipment Familiarization
0% Complete
Wash & Rinse System: 60-gallon fresh water tank + water pump — setup and operation
Wash & Rinse System: Pressure washers (Ryobi 1800 PSI, Bauer 1800 PSI backup) — setup, connecting to water source, PSI

Chemical Training
Watch Chemical Videos
Reference list from Phase 2 of your training checklist. Always wear PPE (gloves/glasses) before handling chemicals.
1
Gloves and glasses on before touching anything. Never mix chemicals together unless a procedure specifically calls for it.
2
Every bottle gets labeled with contents + ratio the moment it's mixed.
3
Go through the Superior Products line one at a time — what each is for, correct ratio, and application method.
4
Go through our permanent staple products the same way.
5
Hands-on mixing drill: you'll measure and mix a labeled bottle/sprayer while your trainer checks your work — before it's ever used on a car.
6
Golden rule: when unsure of a ratio, dilute weaker first. You can always add more concentrate, but you can't undo chemical damage to paint, trim, or upholstery.

Microfiber Towel System
Towels are color-coded by task to prevent cross-contamination. Never use a wheel towel on paint, or an interior towel on glass.
Drying Towels: Large, ultra-plush for exterior drying only.
Glass Towels: Waffle-weave or low-pile to prevent lint.
Interior Towels: Used for plastics, leather, and upholstery.
Wheel/Engine Towels: Dedicated utility towels. Do NOT mix these in the laundry with paint towels.
Decontamination Tools
Used to remove embedded contaminants from the clear coat before polishing or sealing.
Clay Bars: Traditional clay must be kneaded. If dropped on the floor, throw it away immediately.
Synthetic Clay Mitts: Can be rinsed if dropped. Faster for large vehicles.
Lubrication: Always use dedicated clay lube (e.g., EZ Shine) or soapy water. Never use on dry paint.
Polishing Pads
Pads dictate the level of cut and finish. Keep them clean during use by blowing them out with compressed air or using a pad conditioning brush.
Foam Cutting Pads
Firm dense foam for heavy defect removal.
Foam Polishing Pads
Medium density for finishing and light defects.
Microfiber Pads
Maximum cut for hard clear coats. Requires frequent blowing out.

Learning Library

The Learning Library is a broader knowledge resource extending beyond the core SOP system — a collection of standalone, deep-dive guides for more advanced or higher-risk topics that don't fit neatly into a step-based procedure, such as paint correction, headlight restoration, water spot removal, and paint protection/hydrophobicity. Where the SOP system walks through a specific repeatable process step by step, the Learning Library holds the broader "why" and "how it really works" knowledge behind trickier services — the kind of background understanding that helps a technician make good judgment calls mid-job rather than just following a checklist.

What You'll Find Here

Each guide in the library is a standalone document covering one topic in depth — typically including the underlying science or reasoning (for example, why hydrophobicity testing works the way it does), common mistakes to avoid, and conversation scripts for explaining the service to a customer. These are intentionally kept separate from the Master SOP system so that adding rich, narrative-style content here doesn't complicate or destabilize the simpler step-based procedures used elsewhere.

How to Use It

Browse the library by topic, open a guide to read it in full, or download/print it for offline reference. Guides are meant to be read in full at least once during training, then used as a refresher or deeper reference whenever a technician encounters a tricky real-world version of that service.

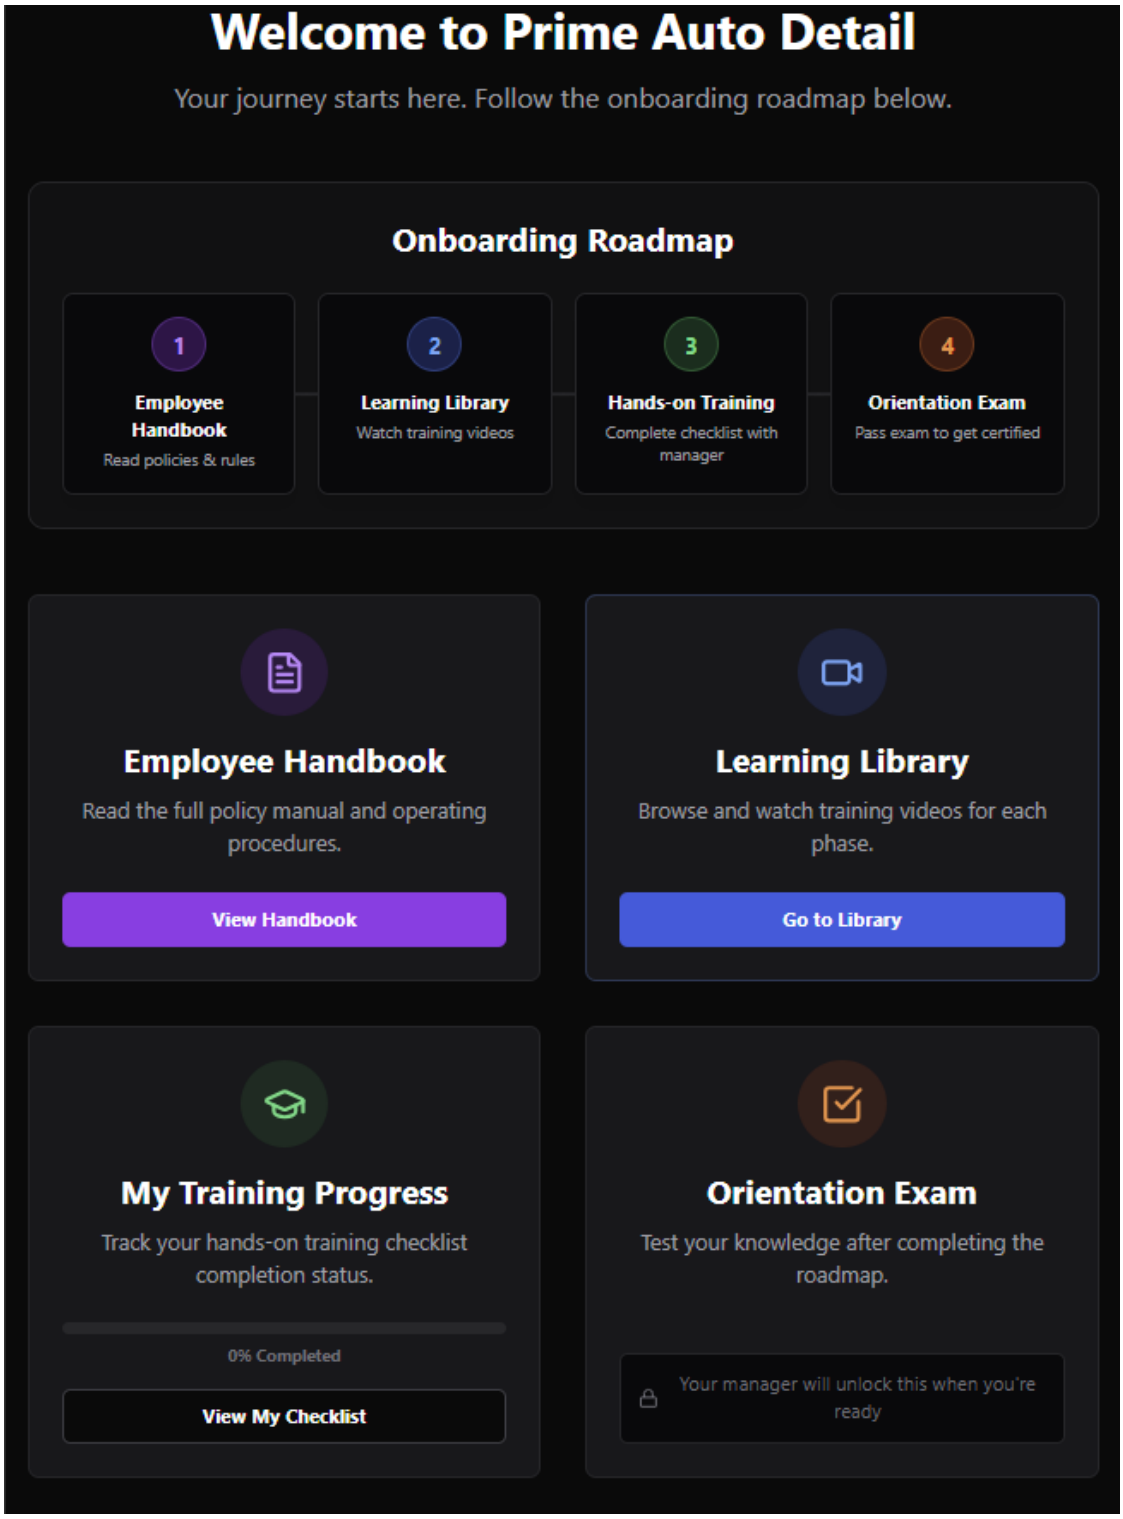

Filters & Sorting Options

- *Filter by topic category (e.g., Paint Correction, Interior, Protection/Coatings)*
- *Filter by skill level (Foundational vs. Advanced)*
- *Search by keyword across all guide content*
- *Sort by most recently added or most frequently referenced*

KEY FEATURES

- *Standalone deep-dive guides for advanced or higher-risk services*
- *Deliberately decoupled from the Master SOP system to avoid over-complicating simpler procedures*
- *Searchable and filterable by topic and skill level*

Orientation

Orientation is the structured first-days experience for a brand-new employee — walking them through what they need to know before their first real job, rather than relying on informal shadowing and verbal explanations alone. It's designed to front-load the basics (how the business runs, where things are, what's expected) so a new hire's actual first job is their first chance to practice skills, not their first time hearing how anything works.

What You'll Find Here

A sequenced set of orientation modules or checklist items — typically covering company policies, where supplies and equipment are kept, safety expectations, how to use the Service Checklist, and who to go to with questions. Progress through orientation is tracked, so management can confirm a new hire has actually completed every required step before their first unsupervised job.

How to Use It

A new employee works through the orientation items in order, marking each as complete. An admin can review completion status at any point to confirm readiness, and the content itself is editable, so orientation keeps pace as the business's actual policies and procedures evolve.

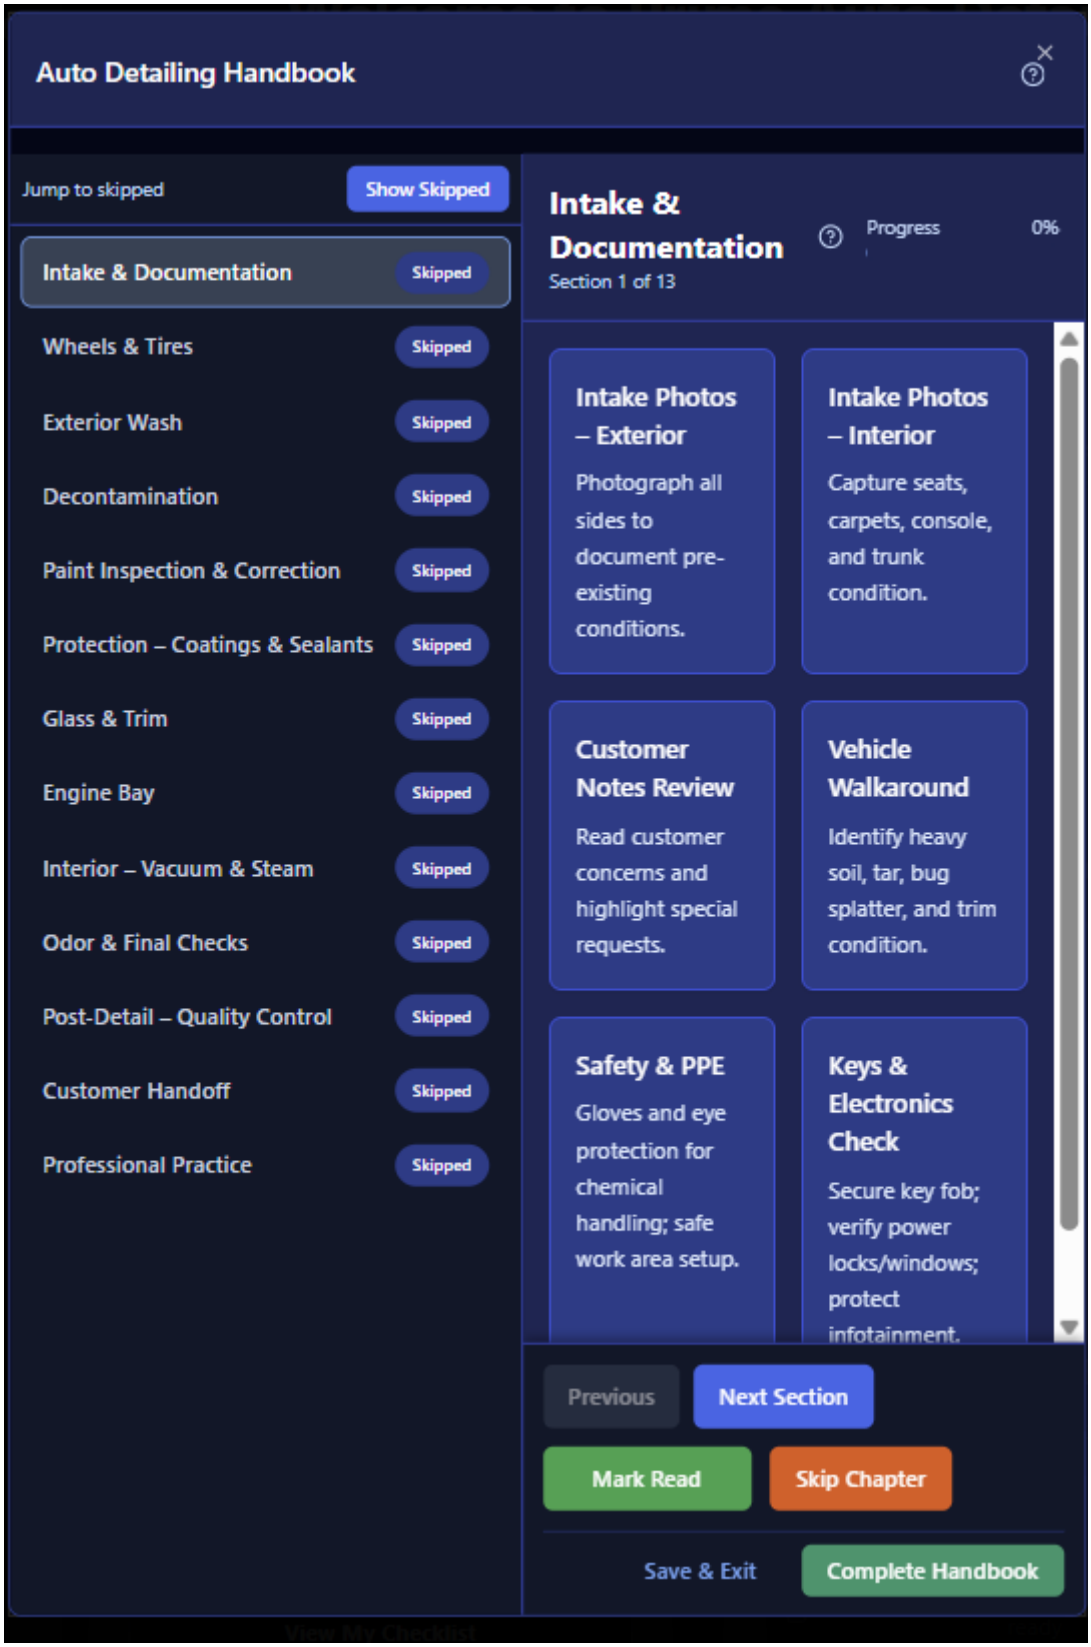

Filters & Sorting Options

- Filter by completion status (Not Started, In Progress, Completed)
- Filter by employee, for admins managing multiple new hires at once
- Sort modules by required sequence or by category (Safety, Policies, Tools, Procedures)

KEY FEATURES

- Sequenced onboarding checklist, not a single unstructured document dump
- Tracked completion status visible to management
- Reduces inconsistency from relying on informal, verbal-only onboarding

Intake Photos – Exterior
Photograph all sides to document pre-existing conditions.
Intake Photos – Interior
Capture seats, carpets, console, and trunk condition.
Customer Notes Review
Read customer concerns and highlight special requests.
Vehicle Walkaround
Identify heavy soil, tar, bug splatter, and trim condition.
Safety & PPE
Gloves and eye protection for chemical handling; safe work area setup.
Keys & Electronics Check
Secure key fob; verify power locks/windows; protect infotainment.

Complete Handbook

The Handbook is the single reference document for company policies, expectations, and standard employment terms — the formal counterpart to the day-to-day procedural knowledge covered in the SOP system and Learning Library. Where those systems teach *how to do the job*, the Handbook covers *how the business itself operates as a workplace*: conduct expectations, time-off and scheduling policies, pay and compensation basics, and anything else an employee might need to reference outside of a specific task.

What You'll Find Here
A structured, searchable document covering company policy sections — typically things like code of conduct, attendance and punctuality expectations, dress code, safety responsibilities, and how compensation and payroll work at a policy level (distinct from the actual Compensation Calculator tool, which does the math).

How to Use It
Read in full during onboarding alongside Orientation, then used afterward as a reference whenever a policy question comes up — for example, confirming the correct procedure for requesting time off, or what the dress code policy actually says.

Filters & Sorting Options

- Table of contents / section jump-to navigation
- Search by keyword across the full handbook text
- Filter or highlight recently updated sections, so returning employees can spot policy changes since they last read it
-

KEY FEATURES

- Single source of truth for workplace policy, separate from job-procedure content
- Searchable rather than a static, hard-to-navigate document
- Highlights recent policy changes so employees don't miss updates

Exam Administration

Exam Administration is where employee knowledge gets formally tested and tracked — turning training from something an employee passively sits through into something measurable. Rather than assuming a technician absorbed everything from Orientation, the Learning Library, and the SOP system, this tool creates and administers real exams, then records whether they actually demonstrated understanding.

What You'll Find Here

A set of exams tied to specific topics or certification levels — for example, a chemical safety exam, a Service Checklist procedures exam, or a broader certification exam covering multiple SOP categories at once. Each exam is built from a question bank, scored automatically upon submission, and tied to that employee's permanent training record.

How to Use It

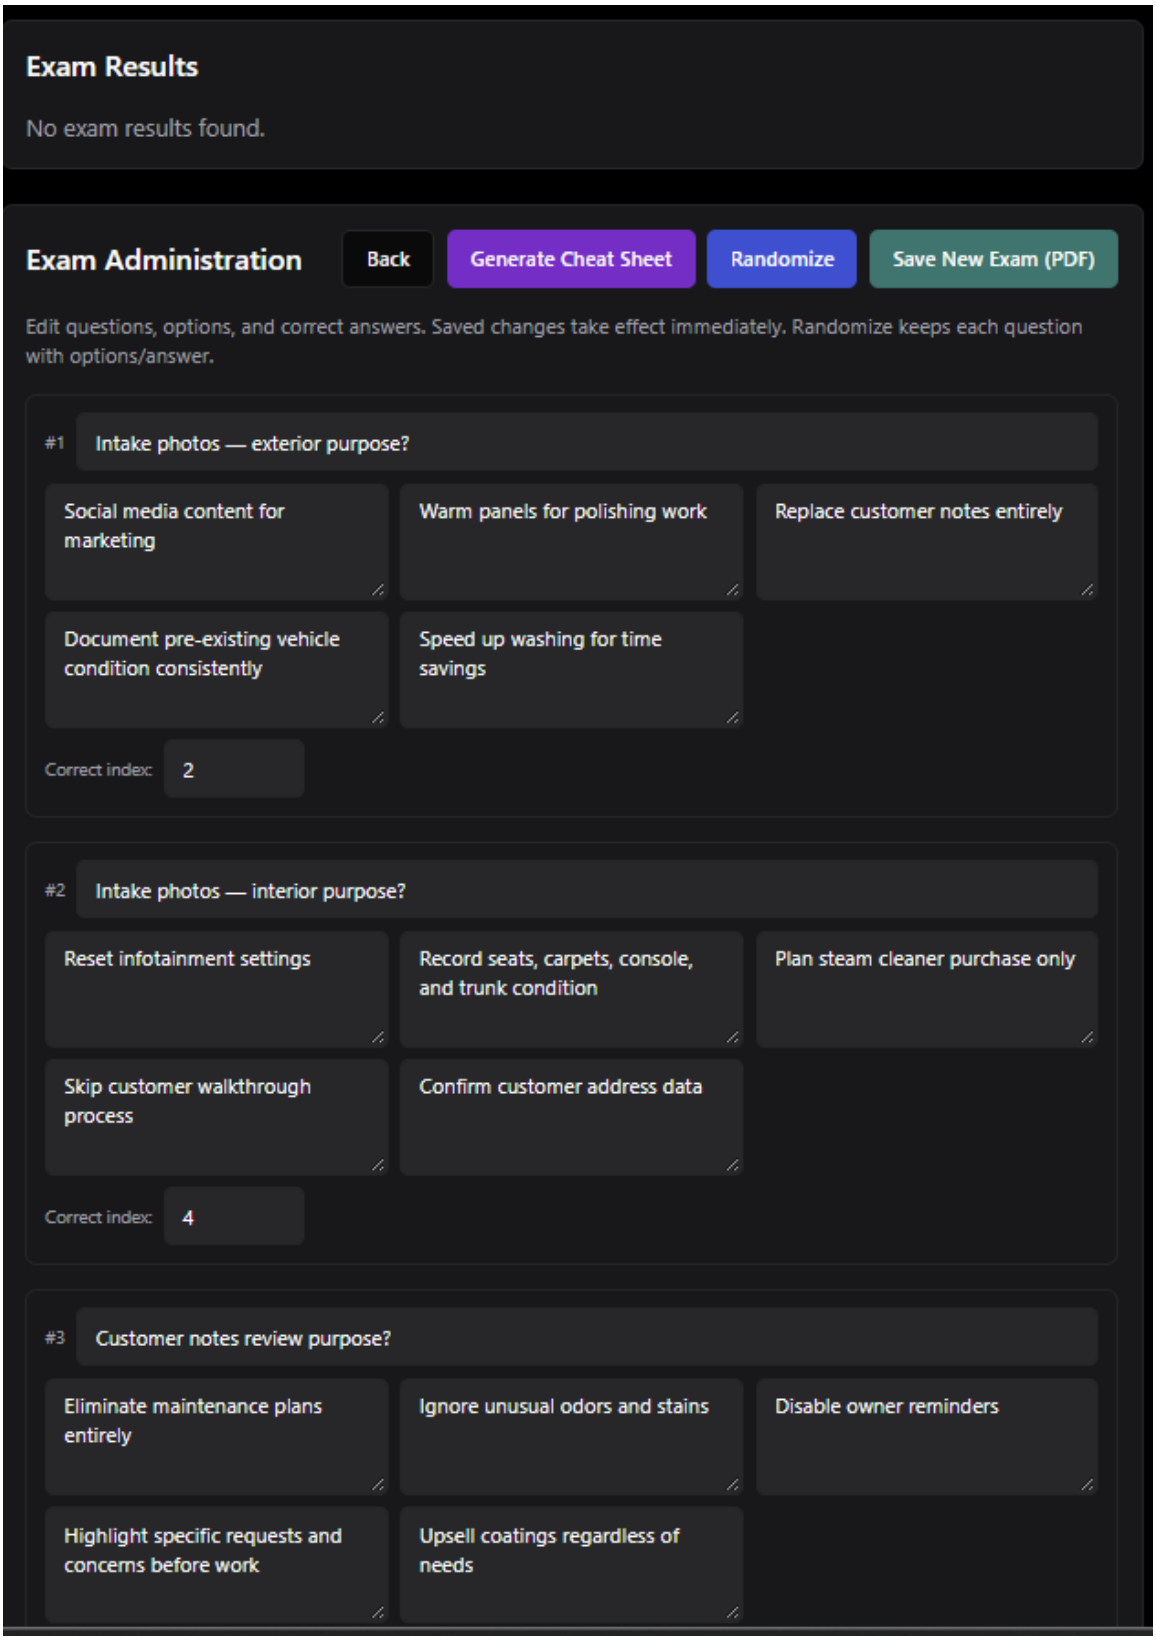

As an admin, you build or select an exam, assign it to one or more employees, and the employee completes it through their own dashboard. Once submitted, the exam is scored, the result is logged against that employee's profile, and a passing or failing status is recorded — which can gate certain certifications or responsibilities until a passing score is achieved.

Filters & Sorting Options

- Filter by employee, to see all exams assigned to or completed by a specific team member
- Filter by exam topic or certification category
- Filter by status (Not Started, In Progress, Passed, Failed, Needs Retake)
- Sort by most recently administered or by score, highest to lowest

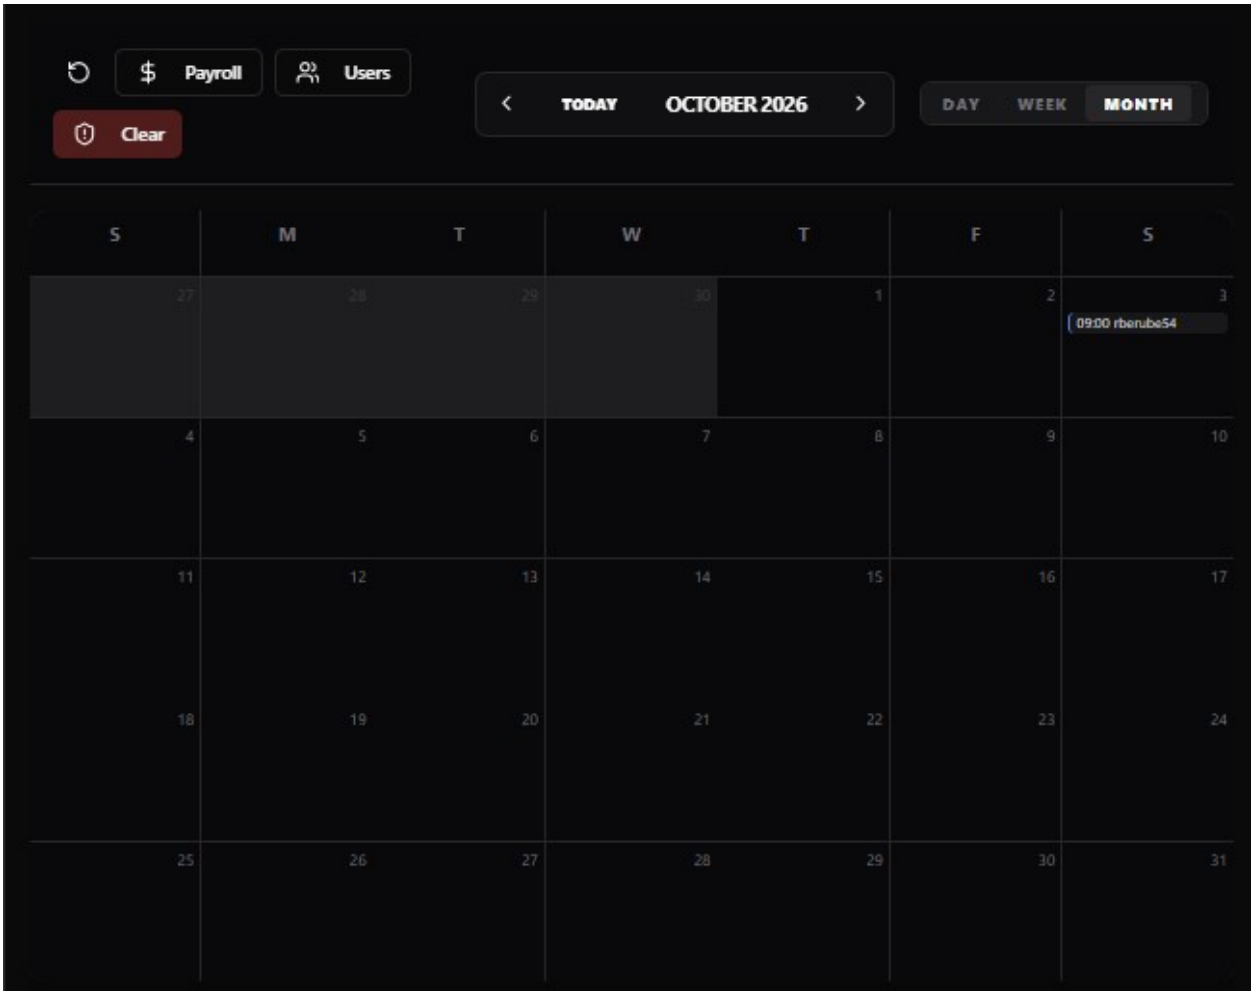

KEY FEATURES

- Automatically scored exams tied directly to an employee's permanent record
- Supports gating certifications or responsibilities behind a passing score
- Centralized view of exam status across the entire team, not just one employee at a time

Replace customer notes entirely
Document pre-existing vehicle condition consistently
Speed up washing for time savings
Correct index:
2
#2
Intake photos — interior purpose?
Reset infotainment settings
Record seats, carpets, console, and trunk condition
Plan steam cleaner purchase only
Skip customer walkthrough process
Confirm customer address data
Correct index:
4
#3
Customer notes review purpose?
Eliminate maintenance plans entirely
Ignore unusual odors and stains
Disable owner reminders
Highlight specific requests and concerns before work
Upsell coatings regardless of needs

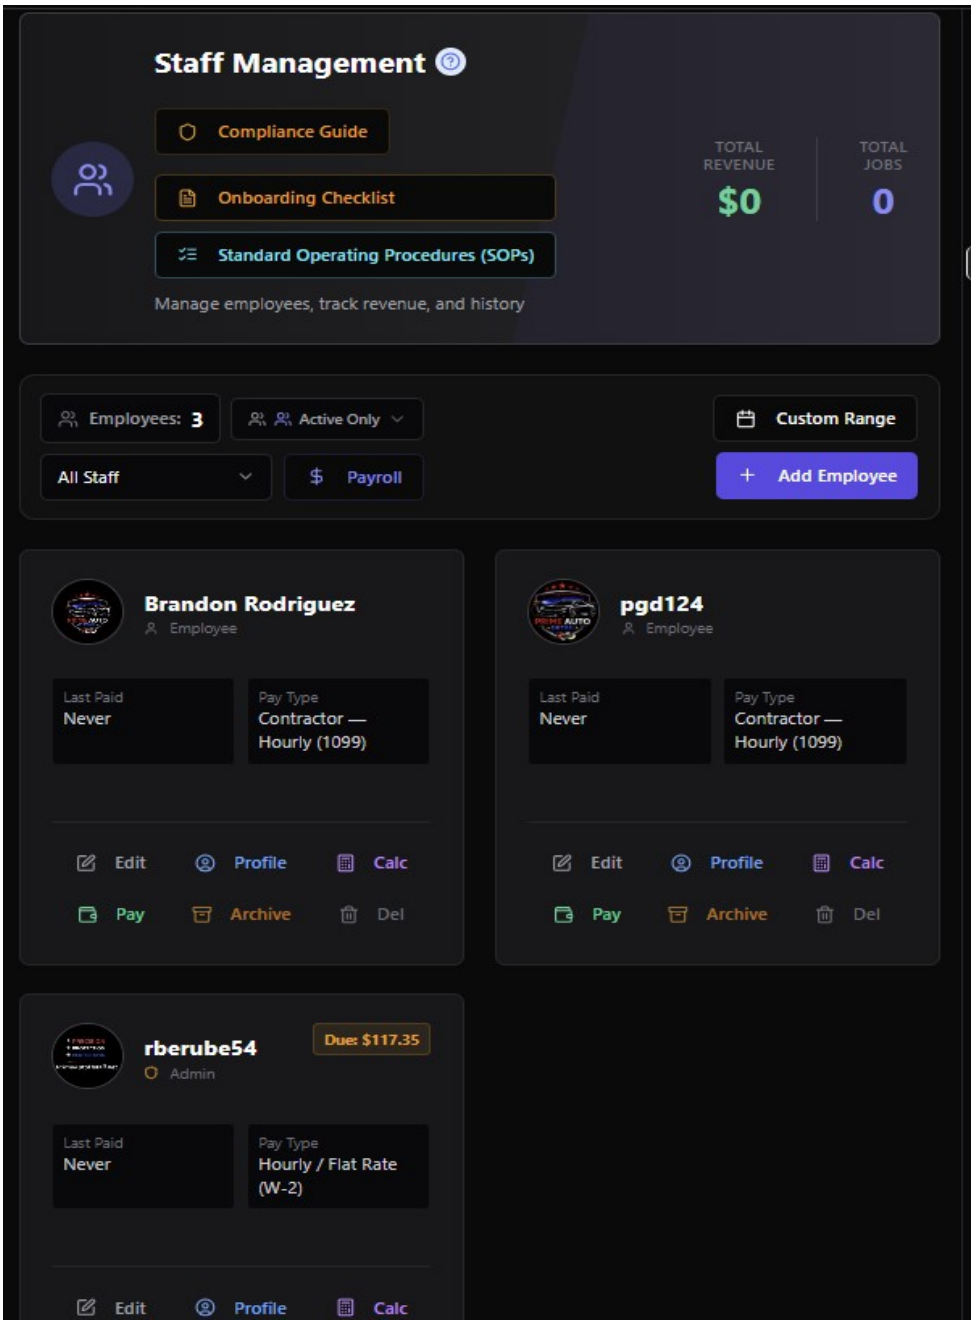

STAFF MANAGEMENT

Staff Schedule

Shift and scheduling management for the whole team, coordinated directly alongside the booking calendar so staffing levels and job volume can be planned together rather than as two disconnected systems.

Company Employees

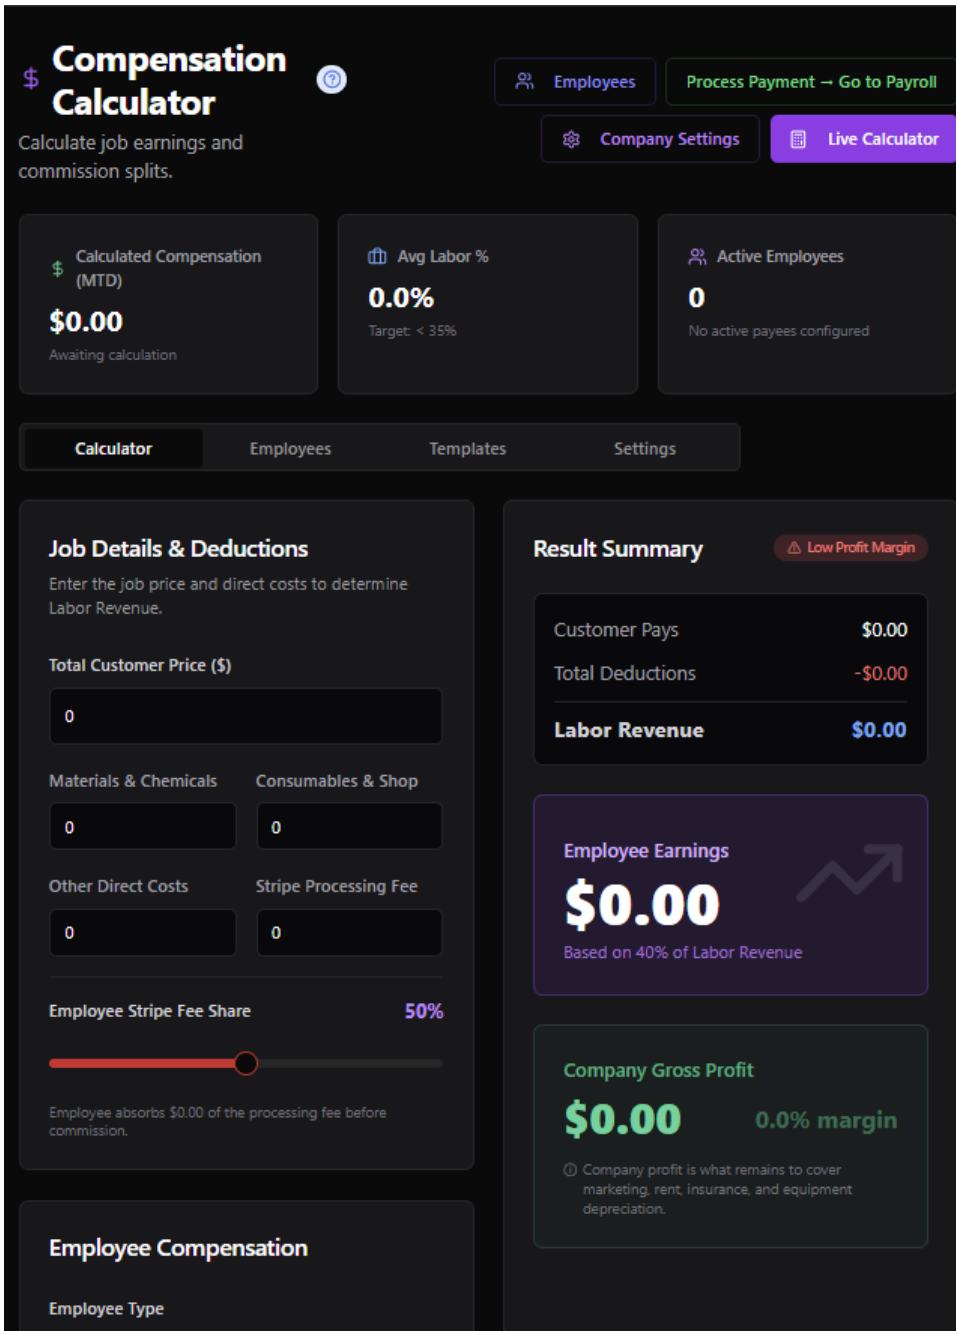

The complete employee management system — a full profile per team member, covering role, contact information, training records, and everything else needed to manage a real team rather than a single-operator business.

KEY FEATURES

- Full employee profile system, not just a contact list
- Central record tying together role, training, and contact info

Compensation Calculator

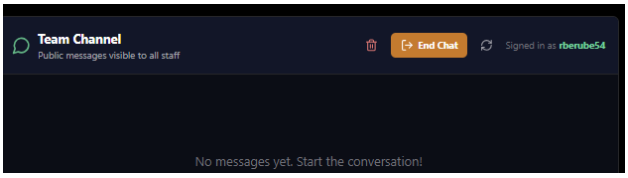

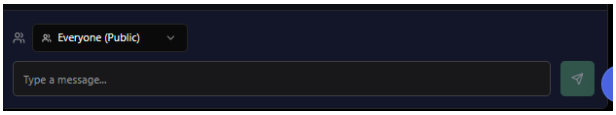

The pay-by-job (piece-rate) compensation engine — calculating technician pay based on the specific jobs they actually completed, rather than a flat hourly wage, so pay scales with productivity and job complexity.

KEY FEATURES

- Piece-rate calculation tied to actual completed jobs
- Rewards productivity rather than paying a flat hourly rate regardless of output

App Team Chat

Team Chat

App Team Chat is secure internal communication for the team, kept completely separate from any customer-facing messaging — so day-to-day staff coordination never risks crossing wires with a customer conversation thread. It's the place for quick operational back-and-forth: confirming a schedule change, flagging a supply that's running low, or coordinating who's covering which job, without cluttering email or mixing it into a system meant for customer communication.

What You'll Find Here

A simple messaging interface scoped to employees and admins only — direct messages and/or group conversation threads, depending on how the team is organized. Since this is internal-only, there's no customer ever present in this channel, which keeps conversations candid and operationally focused.

How to Use It

Send a message to an individual team member or a group thread the same way as any standard messaging app. Admins can typically see across all team communication for oversight purposes, while employees see only the threads they're part of.

Filters & Sorting Options

- Filter by individual conversation or group thread
- Filter by unread messages
- Search by keyword across message history
- Sort conversations by most recent activity

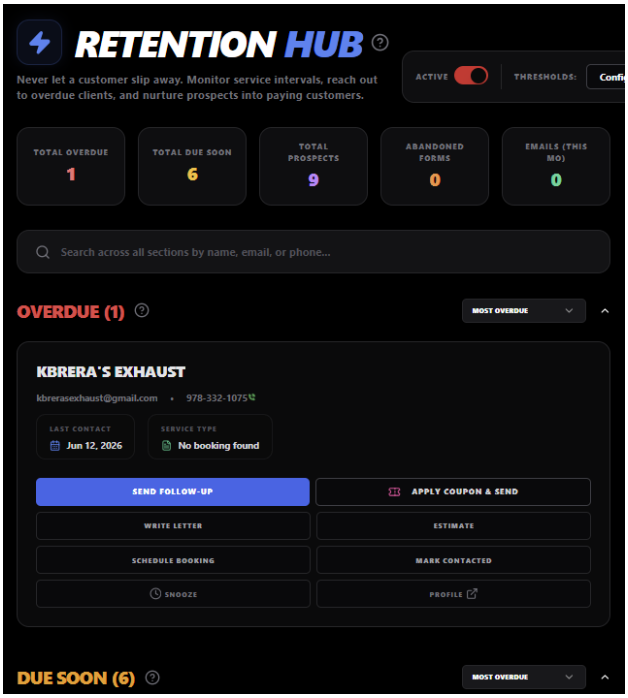

KEY FEATURES

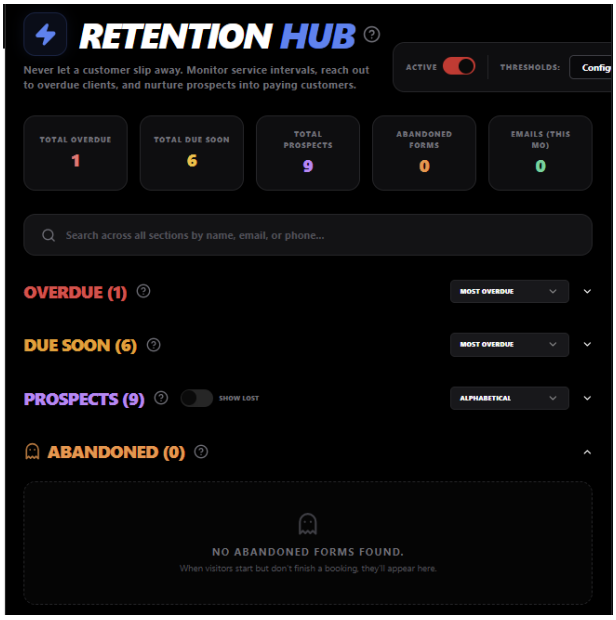

- Fully separated from customer-facing communication channels
- Supports both direct messages and group threads
- Keeps internal coordination fast and out of email

MARKETING & RETENTION

5 feature pages in this category

Follow-up Center

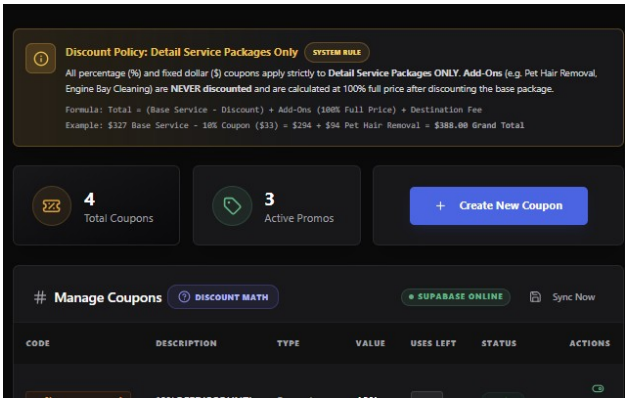

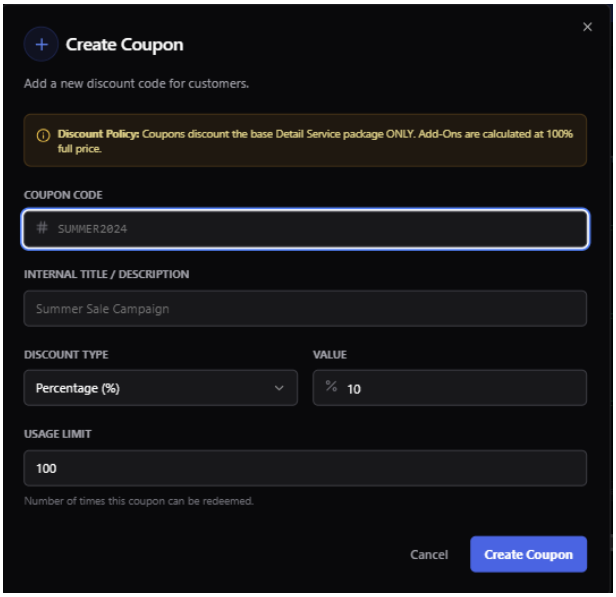

The retention engine of the whole business — tiered thresholds and countdown badges automatically flag customers who are due for their next service, at risk of drifting away, or already effectively lost, so outreach happens proactively instead of relying on customers to remember to call back. Off-season suppression prevents unnecessary outreach during naturally slow periods.

KEY FEATURES

- Tiered due/at-risk/lost thresholds with countdown badges
- Proactive retention rather than passive, customer-initiated rebooking
- Off-season suppression to avoid tone-deaf outreach timing

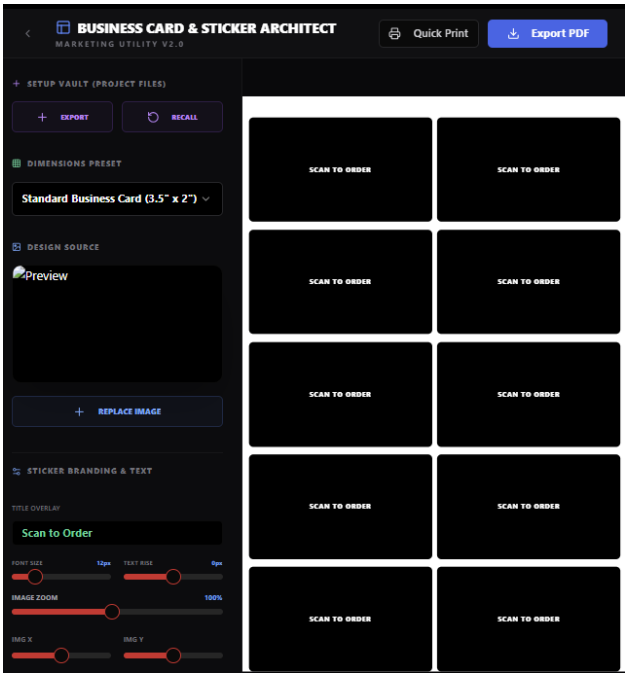

Discount Coupons

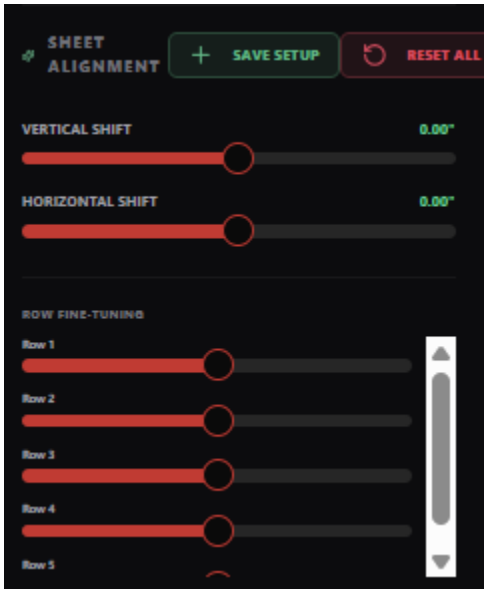

Coupon and promo code creation and management for marketing campaigns — a straightforward tool for running a seasonal promotion or a referral incentive without manually tracking redemptions by hand.

Business Card Stickers

A design tool for generating business card and sticker materials, including QR codes that link straight back to the booking site or a specific promotion — turning a physical handout into a direct digital conversion path.

Elite Story Master

Elite Story Master is a content curation and reordering tool for the featured customer stories and testimonials shown on the public website — giving control over which success stories get top billing on the site, rather than a fixed, unchangeable display order. Where Testimonials Management (under Website Administration) handles the raw content of each testimonial, Elite Story Master is specifically about sequencing and prioritization: deciding which stories a visitor sees first.

What You'll Find Here
A list of existing customer stories/testimonials, with drag-and-drop or up/down reordering controls to change their display priority on the public site. This lets a particularly strong, recent, or persuasive story be pushed to the front, while older or less compelling ones move further down without being deleted entirely.

How to Use It
Review the current story order, then drag a story up or down (or use reorder controls) to change its position. Changes typically reflect live on the public site once saved, letting you keep the most persuasive, current stories front and center as new ones come in.

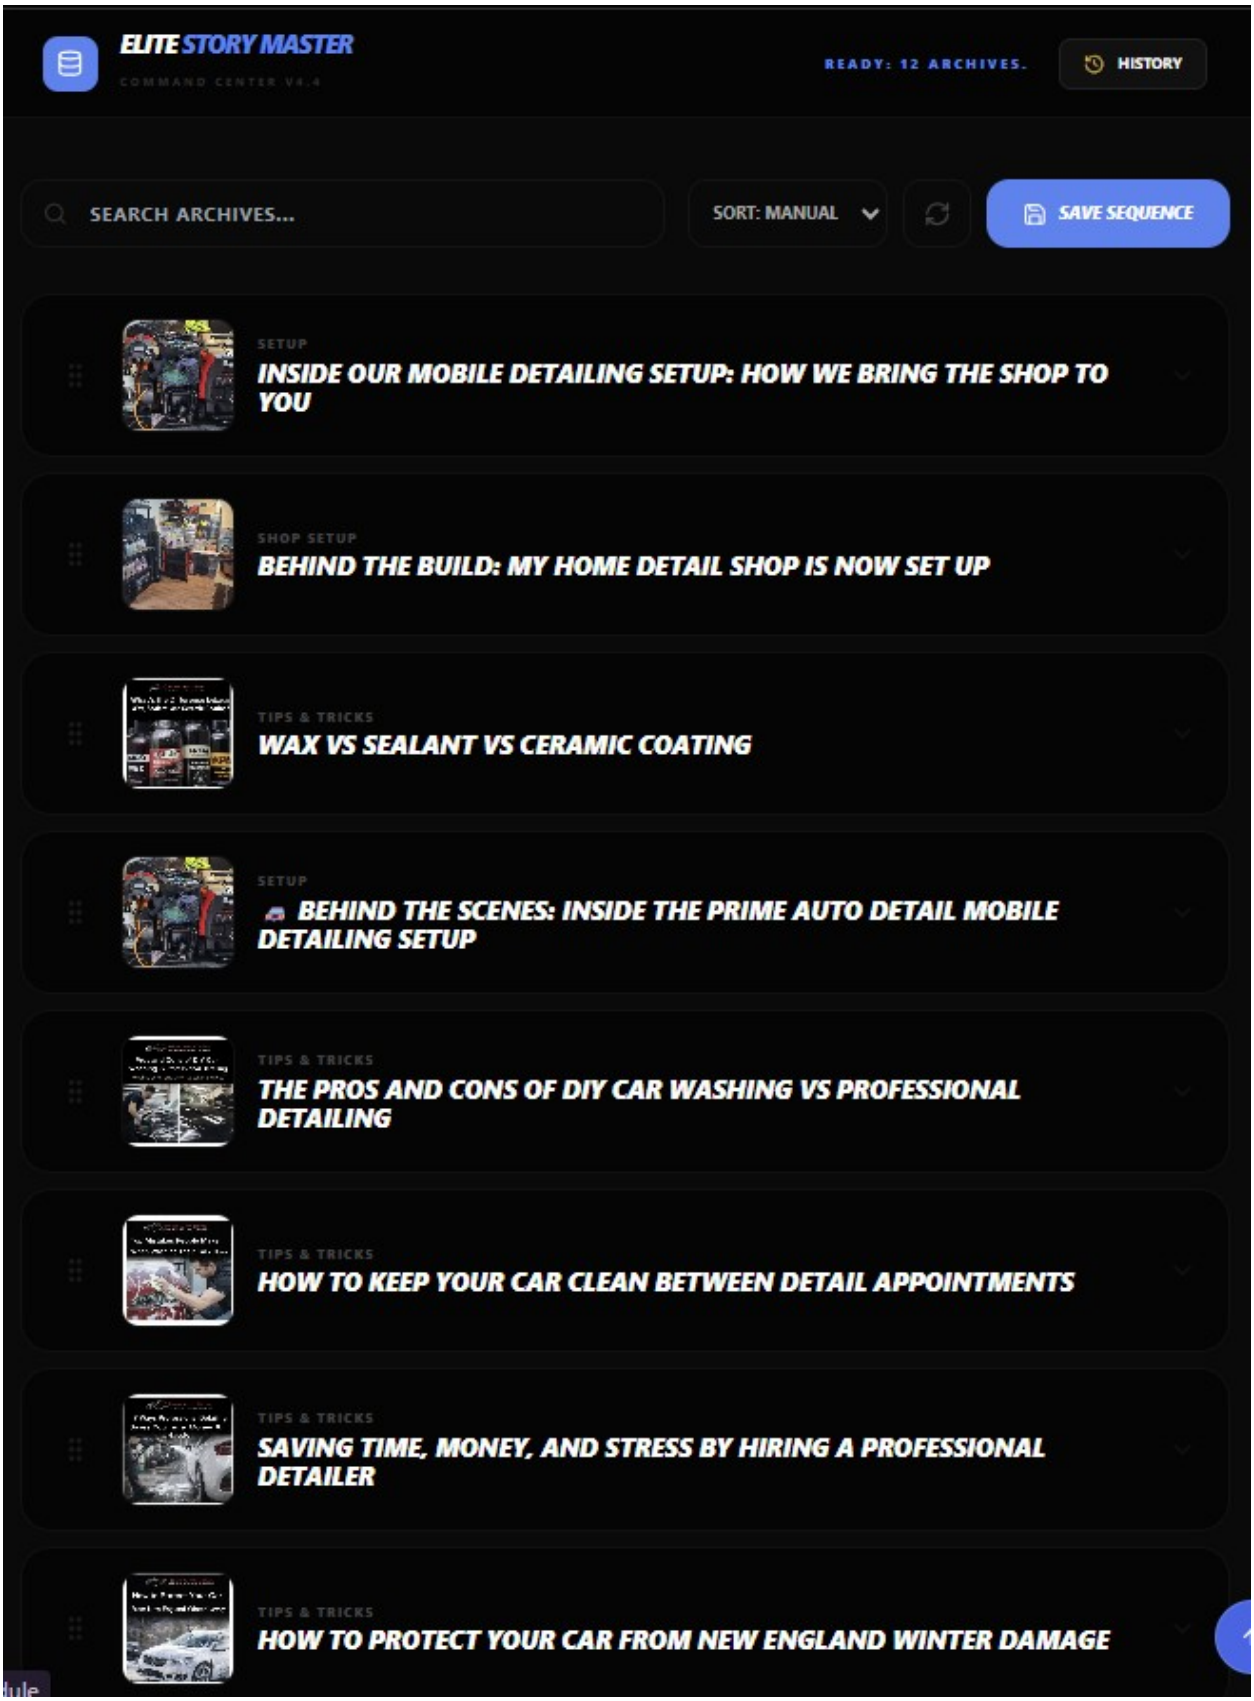

Filters & Sorting Options

- Sort by current display order (default)
- Filter by story status (Active/Featured vs. Archived/Hidden)
- Sort by date added, to find and feature recent wins
- Search by customer name or story keyword
-

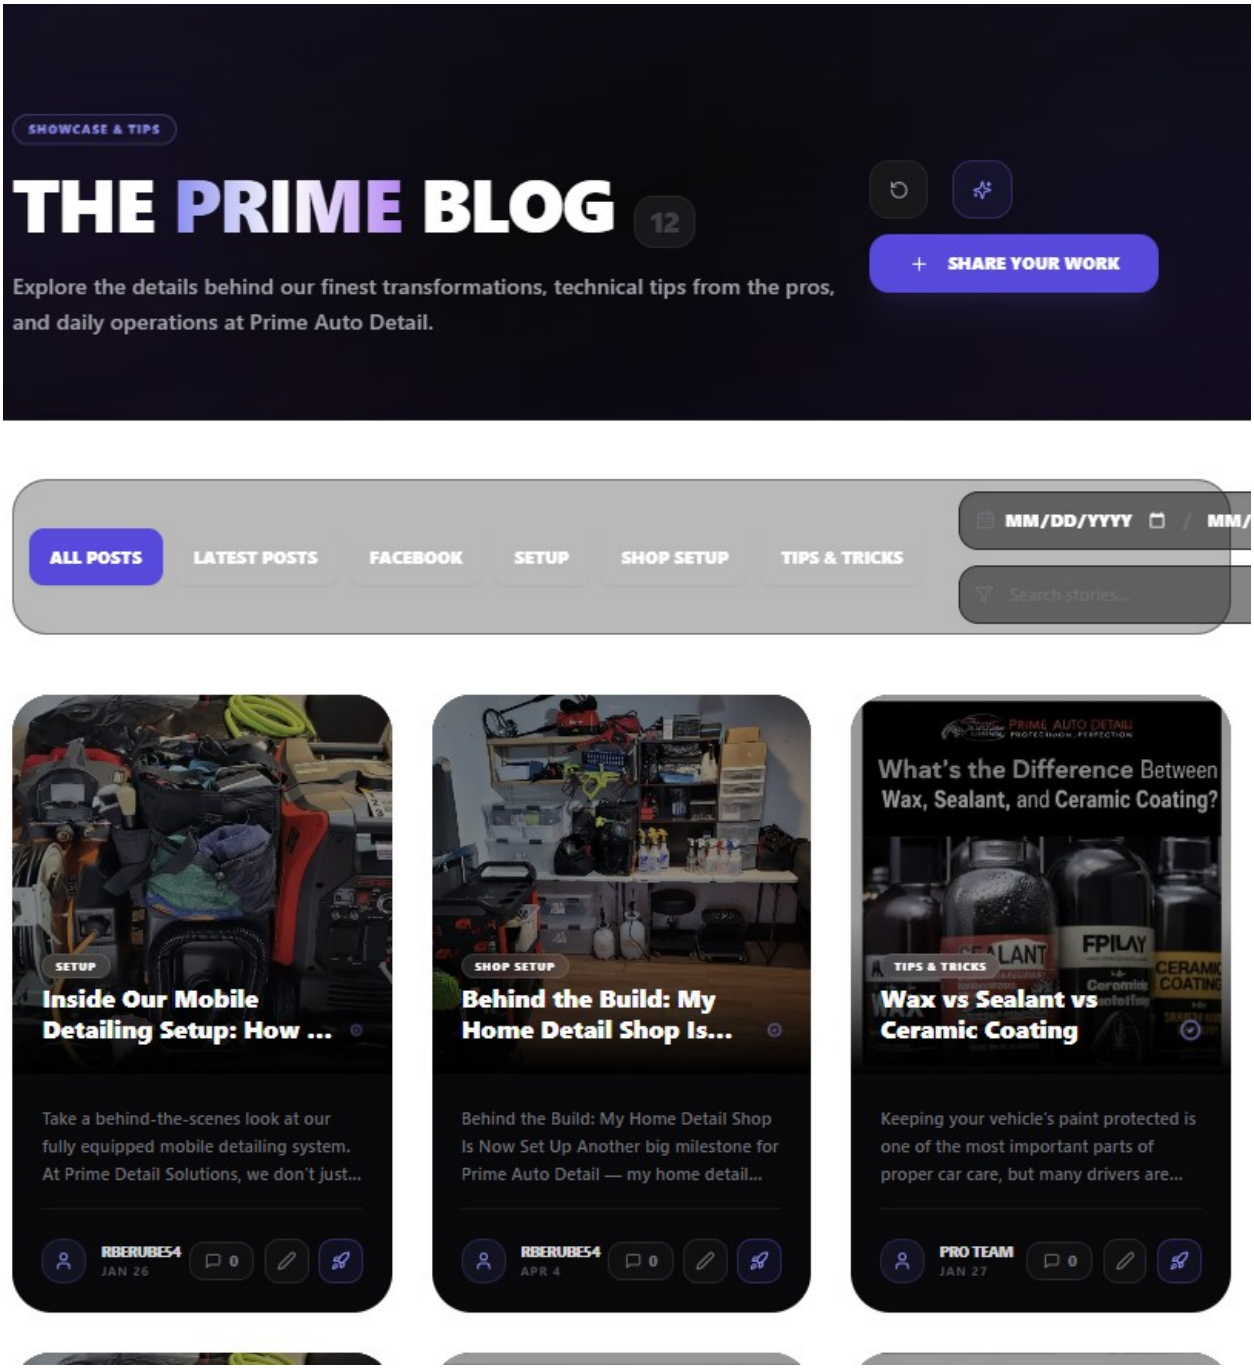

KEY FEATURES

- Drag-and-drop control over which stories appear first to site visitors
- Separate from raw testimonial content editing, focused purely on sequencing

Lets newer or stronger stories be prioritized without deleting older ones
